NATFREQ. A Computer Program for Calculating the Natural Frequency of Rotating Cantilevered Beams Joseph B. Wilkerson, DAVID W TAYLOR NAVAL SHIP RESEARCH AND DEVELOPMENT CENTER BETHESDA MD AVIATION AND SURFACE EFFECTS Dept, 1977 A computer program was developed to evaluate the natural frequencies of model helicopter rotor blades for use in wind tunnel evaluations This program NATFREQ calculates the uncoupled natural frequency and corresponding mode shape of the first second and third natural bending modes for a nonuniform cantilever beam rotating in a vacuum The program includes centrifugal stiffening effects and allows for arbitrary radial distributions of blade mass and stiffness properties The fundamental uncoupled torsional natural frequency may also be calculated for a nonrotating cantilevered nonuniform beam The blade is represented by a series of concentrated masses connected by massless flexures The method of calculation for both bending and torsion is by the use of influence coefficients and matrix algebra Comparison of calculated results for a uniform beam with the exact solution shows that good results are obtained in the fundamental mode for as few as five mass elements However calculated frequencies for the second and third modes of vibration show progressive error This suggests that up to 20 elements should be used for satisfactory results in the higher modes for nonuniform properties Author Spacecraft Structures J. Stamps,2013 Learn LabVIEW 2012 Fast is written for users that have no experience with LabVIEW and only a limited understanding of automatic data acquisition This primer will help you quickly become proficient using LabVIEW and confident in your ability to create applications in a wide variety of data acquisition topics The goal of this primer is to introduce you to LabVIEW for hands on use in automatic data acquisition and controls applications This primer uses a number of practical real life examples to provide both breadth and depth to the topic The real life examples used in this book demonstrate the value of LabVIEW provide motivation for learning LabVIEW and make the examples fun to program The first chapter of this book is designed to introduce you to the general concepts of LabVIEW through the development of a general program that acquires analog input data The rest of the book introduces you to general concepts of data measurement and generation using LabVIEW s DAQ Assistants Express VIs and the configuration approach for automatic data acquisition This primer has a unique modular structure that does not require the chapters to be completed in succession After you complete

the first chapter you are free to complete whichever sections you would like in the order you would like to complete them allowing you to focus on the topics that are of most interest to you Each section in the primer introduces you to a new data acquisition topic After an introduction to the topic a program is developed within this topic using step by step instructions Each chapter concludes with several additional practical application problems where the data acquisition program is given but the detailed steps to create the program are left to you Example problems are provided for all modes of data acquisition including analog input and output digital input and output and counters For example the problems show many aspects of analog input such as hardware and software timing buffered and triggered acquisition and examples with common sensors such as thermocouples and strain gages Examples from other acquisition modes show how to drive many common output devices such as stepper motors servo motors and DC motors as well as software control programs such as the PID compensator and pulse width modulation

Tables of Natural Frequencies and Nodes for Transverse Vibration of Tapered Beams Han-chung Wang,Hanzhong Wang,Will J. Worley,1966 The natural frequencies nodal points and mode functions for transverse vibration of tapered beams are presented in this report The beams considered have the cross sectional area bounded by the curve $y = h\beta z^{\beta\gamma + 1}$ with the thickness h and width b varying along the beam according to the relations

Vibration of Tapered Cantilever Beams John G. Rae,1967 Galerkin s method was used to calculate the natural frequencies of vibration of tapered cantilever beams It was found that the values obtained from Galerkin s method converged very quickly and for small tapers reliable values for the fundamental and second natural frequencies were obtained when two and three terms were used in the trial solution The trial solution which was used in this thesis was found to be unsuitable for calculating natural frequencies of modes higher than the third mode and for calculating the fundamental frequency of vibration when the effects of shearing force and rotatory inertia were considered Tests were conducted to determine the natural frequencies of vibration and it was found that the experimental frequencies were always lower than the theoretical frequencies The largest differences were found for the shorter beams and the beams with the largest thickness taper From the theoretical values which were obtained for the second natural frequency it was noted that for small tapers the frequency of vibration decreased almost linearly as the thickness taper was increased This fact was used to propose a method for finding the second natural frequency of vibration of a beam by using a linear extrapolation
