

## Cell Size

What determines the size of a cell?

### Why?

Sometimes bigger is better—tall basketball players, more closet space, and savings accounts may come to mind. What about cells? Does having big cells make an organism bigger or better? Would having larger cells be an advantage to an organism? If so, why do cells divide rather than continue growing? Maybe there is an advantage to being small.

### Model 1 – Investigating Cell Size

1. Are the cells shown in Model 1 plant or animal cells? Explain your answer.  
**ANIMAL – NO CELL WALL, CHLOROPLAST, LARGE CENTRAL VACUOLE**

2. Label Cell B in Model 1 with the following structures.

cell membrane	cytoplasm	nucleus
ribosomes	vacuole	mitochondria

3. Compare the smaller cell in Model 1 to the larger cell in Model 1.

a. Which cell has a larger surface area (more cell membrane surface)?

**CELL B (LARGER CELL) HAS A LARGER SURFACE AREA THAN CELL A.**

b. Which cell has more channels in its cell membrane that can transport molecules (nutrients, oxygen, and waste products) in and out of the cell?

**CELL B (LARGER CELL) HAS MORE CELL MEMBRANE CHANNELS THAN CELL A.**

## **Model 1 Investigating Cell Size:**

**Investigating Cellular Nanoscale with X-rays** Clément Hémonnot, 2016 The advances and technical improvements of X ray imaging techniques taking advantage of X ray focussing optics and high intensity synchrotron sources nowadays allow for the use of X rays to probe the cellular nanoscale Importantly X rays permit thick samples to be imaged without sectioning or slicing In this work two macromolecules namely keratin intermediate filament IF proteins and DNA both essential components of cells were studied by X ray techniques Keratin IF proteins make up an integral part of the cytoskeleton of epithelial cells and form a dense intracellular network of bundles This network is built from monomers in a hierarchical fashion Thus the keratin structure formation spans a large range of length scales from a few nanometres monomers to micrometres networks Here keratin was studied at three different scales i filaments ii bundles and iii networks Solution small angle X ray scattering revealed distinct structural and organisational characteristics of these highly charged polyelectrolyte filaments such as increasing radius with increasing salt concentration and spatial accumulation of ions depending on the salt concentration The results are quantified by employing advanced modelling of keratin IFs by a core cylinder flanked with Gaussian chains Scanning micro diffraction was used to study keratin at the bundle scale Very different morphologies of keratin bundles were observed at different salt conditions At the network scale new imaging approaches and analyses were applied to the study of whole cells Ptychography and scanning X ray nano diffraction imaging were performed on the same cells allowing for high resolution in real and reciprocal space thereby revealing the internal structure of these networks By using a fitting routine based on simulations of IFs packed on a hexagonal lattice the radius of each filament and distance between filaments were retrieved In mammalian cells each nucleus contains 2 nm thick DNA double helices with a total length of about 2 m The DNA strands are packed in a highly hierarchical manner into individual chromosomes DNA was studied in intact cells by visible light microscopy and scanning X ray nano diffraction unveiling the compaction and decompaction of DNA during the cell cycle Thus we obtained information on the aggregation state of the nuclear DNA at a real space resolution on the order of few hundreds nm To exploit to the reciprocal space information individual diffraction patterns were analysed according to a generalised Porod's law at a resolution down to 10 nm We were able to distinguish nucleoli heterochromatin and euchromatin in the nuclei and follow the compaction and decompaction during the cell division cycle

Woldringh,Jaen Männik,2016-05-02 Bacterial Physiology was inaugurated as a discipline by the seminal research of Maal e Schaechter and Kjeldgaard published in 1958 Their work clarified the relationship between cell composition and growth rate and led to unravel the temporal coupling between chromosome replication and the subsequent cell division by Helmstetter et al a decade later Now after half a century this field has become a major research direction that attracts interest of many scientists from different disciplines The outstanding question how the most basic cellular processes mass growth chromosome replication and cell division are inter coordinated in both space and time is still unresolved at the molecular level Several particularly pertinent questions that are intensively studied follow a what is the primary signal to place the Z ring precisely between the two replicating and segregating nucleoids b Is this coupling related to the structure and position of the nucleoid itself c How does a bacterium determine and maintain its shape and dimensions Possible answers include gene expression based mechanisms self organization of protein assemblies and physical principles such as micro phase separations by excluded volume interactions diffusion ratchets and membrane stress or curvature The relationships between biochemical reactions and physical forces are yet to be conceived and discovered This e book discusses the above mentioned and related questions The book also serves as an important depository for state of the art technologies methods theoretical simulations and innovative ideas and hypotheses for future testing Integrating the information gained from various angles will likely help decipher how a relatively simple cell such as a bacterium incorporates its multitude of pathways and processes into a highly efficient self organized system The knowledge may be helpful in the ambition to artificially reconstruct a simple living system and to develop new antibacterial drugs     *New Biomarkers for the Diagnosis and Treatment of Systemic Lupus Erythematosus* Trine N.
