1. A web designer installed the latest video editing software and now notices that when the application loads, it responds slowly. Also the hard disk LED is constantly flashing when the application is in use. What is a solution to solve the performance problem?

- replacing the hard disk with a faster model
- upgrading to a faster CPU
- replacing the video card with a model that has a DVI output
- adding more RAM**

Explanation: RAM problems are often caused by faulty RAM modules, loosely seated modules, an inadequate amount of RAM, and compatibility issues. When there is not enough RAM in the computer, data needs to be swapped often between the RAM and the hard disk (indicated by hard disk LED constantly flashing), which significantly slows down data access speeds.

2. An employee reports that each time a workstation is started it locks up after about 5 minutes of use. What is the most likely cause of the problem?

- The hard disk is failing.
- The RAM is malfunctioning.
- The CPU is overheating.**
- The power supply fails to provide adequate voltage and current.

Explanation: Processor problems are often caused by faulty installations, incorrect CMOS setup, inadequate cooling and ventilation, and BIOS compatibility issues.

3. A technician is troubleshooting a 4-year-old computer that takes a long time to boot, and identifies that the BIOS rediscovers all the hardware at every boot. What action would fix this problem?

- Replace the CMOS battery.**
- Launch Device Manager to discover new hardware.
- Reset the BIOS using the CMOS jumper.
- Start the computer with the last known good configuration.

Explanation: The CMOS battery helps the BIOS to keep the discovered hardware as non-volatile information. The Device Manager will discover new hardware in the operating system. Resetting the BIOS using the CMOS jumper will erase the stored information about the hardware found. The last
