The Human Lash Cycle

As with all human hair, eyelashes grow in three phases. This means that each lash is at a different stage of the growth cycle, some may be growing while others lay dormant. Even though eyelashes are regarded as an emphasis of beauty, their primary function is to protect the eyes from small particles such as dust, sweat and debris.

It is important that we understand the lash growth cycle to help us recognise why your client will require maintenance appointments.

The three stages of the lash growth cycle

ANAGEN	This is also known as the "growth phase" this stage of the lash cycle usually last between 30 and 45 days. Approximately 85-90% of upper lashes and 10% of lower lashes are in this stage at any given time.
CATAGEN	This is also known as the "transition phase" once lashes in the growth phase have reached their designated length, they stop growing, the hair follicle shrinks, and they move into the transition phase. This phase lasts between 2-3 weeks.
TELOGEN	This is also known as the "resting" or "shedding" phase. The phase can last between 1-6 months. During this time a new lash begins to grow from the hair follicle. As it grows upwards, the old hair will shed naturally or may be pulled out.

Mapping & Styling

When mapping the eye for your client you need to take into consideration which style would complement our clients eye shape best. Often your client will request a particular look, but it is our job as professionals to advise and offer alternatives.

Mapping enables us to create a bespoke set of lashes for our clients and ensure symmetry between both the eyes. Mapping should be completed once the client's eye has been prepared with primer etc.

MOST POPULAR MAPS TO USE

The cat eye map creates an illusion of a wider upper eye by placing the longest lengths directly in the corner of the eye.

WING

The wing map is very versatile, and there are many different looks to this concept. It involves placing a variety of lengths in a set structural sequence to create a more winged look.

All About Your Adhesive

One of the most significant factors in your lash fit is your lash adhesive. Finding the right adhesive for you can be tough, but once you find one that suits the you and your environment it will be your best friend.

WHAT IS CYANOACRYLATE?

The main ingredient found in lash adhesives is Cyanoacrylate. Cyanoacrylate polymerises, cures and hardens in the presence of moisture. This makes cyanoacrylates and other ingredients along with the adhesive's viscosity will determine the drying time. It is important that you are working with an adhesive that matches the speed in which you are working. An adhesive you may want to try is slower setting adhesives, when you have gained an speed and confidence you can then transition into a faster drying time adhesive.

Important factors about drying time

An important factor which influences the drying time is adhesive, its humidity, and temperature. As a result, it can affect the retention and how you work. The ideal temperature for working with most eyelash adhesives is between 18 to 24°C. The best humidity for eyelash adhesives is 60 to 70%, in lower humidity retention often fails. When polymerising too slowly you will not dry your adhesive. If your adhesive is drying quickly, it is a sign of the humidity in your room is too high, you can use a dehumidifier or an air conditioning unit to reduce humidity. If your adhesive is not drying fast enough, it is a sign of your humidity is too low and a humidifier or steam can be used to help increase the moisture in the air and reduce the drying time.

STORING YOUR ADHESIVE

- Before opening adhesive check seal for 7 months.
- Once opened, put the lid on the lid adhesive from inside down.
- Keep in a cool dry place, away from sunlight preferably inside an light container.
- Never leave the lid off.
- Do not use if the adhesive is old or if it has a strong smell.
