The second half of this century will remain as the era of proliferation of electronic computers. They did exist before but they were mechanical. During next century they may perform other mutations to become optical or molecular or even biological. Actually all these aspects are only fancy dresses put on mathematical machines. This was always recognized to be true in the domain of software where machine or high level languages are more or less rigorous but immaterial variations of the universally accepted mathematical language aimed at specifying elementary operations, functions, algorithms and processes. But even a mathematical machine needs a physical support and this is what hardware is all about. The invention of hardware description languages HDLs in the early 60s was an attempt to stay longer at an abstract level in the design process and to push the stage of physical implementation up to the moment when no more technology independent decisions can be taken. It was also an answer to the continuous exponential growth of complexity of systems to be designed. This problem is common to hardware and software and may explain why the syntax of hardware description languages has followed with a reasonable delay of ten years the evolution of the programming languages at the end of the 60s: they were Algol like a decade later Pascal like and now they are C or ADA like. They have also integrated the new concepts of advanced software specification languages.

VHDL for Simulation, Synthesis and Formal Proofs of Hardware Jean Mermet, 2012-12-06

The success of VHDL since it has been balloted in 1987 as an IEEE standard may look incomprehensible to the large population of hardware designers who had never heard of Hardware Description Languages before for at least 90% of them as well as to the few hundreds of specialists who had been working on these languages for a long time. 25 years for some of them. Until 1988 only a very small subset of designers in a few large companies were used to describe their designs using a proprietary HDL or sometimes a HDL inherited from a University when some software environment happened to be developed around it allowing usability by third parties. A number of benefits were definitely recognized to this practice such as functional verification of a specification through simulation, first performance evaluation of a tentative design and sometimes automatic microprogram generation or even automatic high level synthesis. As there was apparently no market for HDLs the ECAD vendors did not care about them. Start up companies were seldom able to survive in this area and large users of proprietary tools were spending more and more people and money just to maintain their internal system.
