patient care The purpose of this study is to target instructional support for improved nurse numeracy skills toward the end of improved patient care

Methods The current study employed a math test administered to 47 community college RN students The test assessed both general and clinical numeracy skills The hypothesis was that test results would identify specific skills that could be targeted for intervention at the pre RN program high school RN program or professional development levels

Results Data showed RN students most in need of intervention in decimal and percent use for general skills with application to drug dosages requiring multiple unit conversions Clinical numeracy scores correlated significantly with general numeracy scores Contrast among first vs later semester RN students showed that scores of first semester students were higher than for those further progressed in the program

Conclusion These data suggest a need for increased instruction in decimal and percent operations and use of these operations to compute drug dosage in a context of proportion or dimensional analysis These data also emphasize the importance of admission criteria and continuing education in dosage calculation
