### 2-3 COMPRESSION CHECK

A compression check is extremely important, because an engine with low or uneven compression between cylinders **CAN NOT** be tuned to operate satisfactorily. Therefore, it is essential that any compression problem be corrected before proceeding with the tune-up procedure. See Chapter 3.

If the powerhead shows any indication of overheating, such as discolored or scorched paint, especially in the area of the No. 1 cylinder (top on 3-cylinder units and top

onboard tank on VWS), inspect the cylinders visually thru the transfer ports for possible scoring. A more thorough inspection can be made if the heads are removed. It is possible for a cylinder with satisfactory compression to be scored slightly. Also, check the water pump. The overheating condition may be caused by a faulty water pump.

An overheating condition may also be caused by running the engine out of the water. For unknown reasons, many operators have the misconception that running an engine for a short period of time without the lower unit submerged in water, can be done without harm. **FALSE!** Such a practice will result in an overheated condition in a matter of **SECONDS**.

Water must circulate through the lower unit to the engine any time the engine is run to prevent damage to the water pump and an overheating condition. Just five seconds without water will damage the water pump and cause the engine to overheat.

#### Checking Compression

A compression check should be taken in each cylinder before spending time and money on tune-up work. Without adequate compression, efforts to adjust engine performance will be wasted.
