

# Bayesian networks

- Directed graphical model
- Nodes associated with variables
- “Draw” independence in conditional probability expansion
  - Parents in graph are the RHS of conditional

• Ex:  $p(x, y, z) = p(x) p(y | x) p(z | y)$

• Ex:  $p(a, b, c, d) = p(a) p(b | a) p(c | a, b) p(d | b)$

*Graph must be **acyclic***

Corresponds to an order  
over the variables  
(chain rule)

**Modeling and Reasoning with Bayesian Networks** Adnan Darwiche, 2009-04-06 This book provides a thorough introduction to the formal foundations and practical applications of Bayesian networks. It provides an extensive discussion of techniques for building Bayesian networks that model real world situations including techniques for synthesizing models from design learning models from data and debugging models using sensitivity analysis. It also treats exact and approximate inference algorithms at both theoretical and practical levels. The author assumes very little background on the covered subjects supplying in depth discussions for theoretically inclined readers and enough practical details to provide an algorithmic cookbook for the system developer. Modeling and Reasoning with Bayesian Networks Adnan Darwiche, 2009 A thorough introduction to the formal foundations and practical applications of Bayesian networks. It provides an extensive discussion of techniques for building Bayesian networks that model real world situations including techniques for synthesizing models from design learning models from data and debugging models using sensitivity analysis. It also treats exact and approximate inference algorithms at both theoretical and practical levels. The treatment of exact algorithms covers the main inference paradigms based on elimination and conditioning and includes advanced methods for compiling Bayesian networks, time space tradeoffs and exploiting local structure of massively connected networks. The treatment of approximate algorithms covers the main inference paradigms based on sampling and optimization and includes influential algorithms such as importance sampling, MCMC and belief propagation. The author assumes very little background on the covered subjects supplying in depth discussions for theoretically inclined readers and enough practical details to provide an algorithmic cookbook for the system developer. *Modeling, Learning and Reasoning with Structured Bayesian Networks* Yujia Shen, 2020 Probabilistic graphical models e.g. Bayesian Networks have been traditionally introduced to model and reason with uncertainty. A graph structure is crafted to capture knowledge of conditional independence relationships among random variables which can enhance the computational complexity of reasoning. To generate such a graph one sometimes has to provide vast and detailed knowledge about how variables interact which may not be readily available. In some cases although a graph structure can be obtained from available knowledge it can be too dense to be useful computationally. In this dissertation we propose a new type of probabilistic graphical models called a Structured Bayesian network (SBN) that requires less detailed knowledge about conditional independences. The new model can also leverage other types of knowledge including logical constraints and conditional independencies that are not visible in the graph structure. Using SBNs different types of knowledge act in harmony to facilitate reasoning and learning from a stochastic world. We study SBNs across the dimensions of modeling inference and learning. We also demonstrate some of their applications in the domain of traffic modeling. Machine

**Integrated Models of Cognitive Systems** Wayne D. Gray, 2007-04-19 The field of cognitive modeling has progressed beyond modeling cognition in the context of simple laboratory tasks and begun to attack the problem of modeling it in more complex realistic environments such as those studied by researchers in the field of human factors The problems that the cognitive modeling community is tackling focus on modeling certain problems of communication and control that arise when integrating with the external environment factors such as implicit and explicit knowledge emotion cognition and the cognitive system These problems must be solved in order to produce integrated cognitive models of moderately complex tasks Architectures of cognition in these tasks focus on the control of a central system which includes control of the central processor itself initiation of functional processes such as visual search and memory retrieval and harvesting the results of these functional processes Because the control of the central system is conceptually different from the internal control required by individual functional processes a complete architecture of cognition must incorporate two types of theories of control Type 1 theories of the structure functionality and operation of the controller and type 2 theories of the internal control of functional processes including how and what they communicate to the controller This book presents the current state of the art for both types of theories as well as contrasts among current approaches to human performance models It will be an important resource for professional and student researchers in cognitive science cognitive engineering and human factors Contributors Kevin A Gluck Jerry T Ball Michael A Krusmark Richard W Pew Chris R Sims Vladislav D Veksler John R Anderson Ron Sun Nicholas L Cassimatis Randy J Brou Andrew D Egerton Stephanie M Doane Christopher W Myers
