more complicated problems that are not taken into account while designing single stage gear drives Design applications are generally made by trial and error methods depending on the experience and the intuition of the designer In this study using Visual Basic 6.0 an interactive program is developed for designing multistep involute standard and nonstandard spur gearbox according to the American Gear Manufacturers Association AGMA Standards 218.01 and 2001 B88 All the equations for calculating the pitting resistance geometry factor I and the bending strength geometry factor J are valid for external spur gears that are generated by rack type tools rack cutters or hobs The program is made for two stage to six stage gear drives which are commonly used in the industry Compactness of gear pairs and gearbox and equality of factor of safety against bending failure is taken as the design objective By considering the total required gear ratio the number of reduction stages is input by the user Gear ratios of every stage is distributed to the stages according to the total gear ratio that satisfies the required precision from 0.1 to 0.00001 on overall gear ratio depending on the user selected constraints unequal gear ratio for every stage noninteger gear ratio e.g. Dimensional design is determined by considering bending stress pitting stress and involute interference constraints These steps are carried out iteratively until a desirable solution is acquired The necessary parameters for configuration design such as number of teeth module addendum modification coefficient are selected from previously determined gear pairs that satisfies the constraints by user interaction considering the performance criterion from the develop
