Cell Phone Jammer Circuit Explanation:

- If you understand the above circuit, this circuit analysis is simple and easy. For any jammer circuit, remember that there are three main important circuits. When they are combined together, the output of that circuit will work as a jammer. The three circuits are
 1. RF amplifier.
 2. Voltage controlled oscillator.
 3. Tuning circuit.
- So the transistor Q1, capacitors C4 & C5 and resistor R1 constitute the RF amplifier circuit. This will amplify the signal generated by the tuned circuit. The amplification signal is given to the antenna through C6 capacitor. Capacitor C6 will remove the DC and allow only the AC signal which is transmitted in the air.

Confidential Computing Vicente Garcia Diaz, Gloria Jeanette Rincón Aponte, 2022-09-22 This book highlights the three pillars of data security viz protecting data at rest in transit and in use Protecting data at rest means using methods such as encryption or tokenization so that even if data is copied from a server or database a thief cannot access the information Protecting data in transit means making sure unauthorized parties cannot see information as it moves between servers and applications There are well established ways to provide both kinds of protection Protecting data while in use though is especially tough because applications need to have data in the clear not encrypted or otherwise protected in order to compute But that means malware can dump the contents of memory to steal information It does not really matter if the data was encrypted on a server's hard drive if it is stolen while exposed in memory As computing moves to span multiple environments from on premise to public cloud to edge organizations need protection controls that help safeguard sensitive IP and workload data wherever the data resides Many organizations have declined to migrate some of their most sensitive applications to the cloud because of concerns about potential data exposure Confidential computing makes it possible for different organizations to combine data sets for analysis without accessing each other's data
