A. Analytical Balance

Analytical balances (Fig. 1) are used for very precise measurements of mass to the nearest 0.0001 g. However, this accuracy comes at a price. Not only are they expensive (at least \$3000 each) but also sensitive to environmental conditions that can affect the mass reading. Table 1 lists sources of error and how to prevent them.

Figure 1. Analytical balance

To Weigh a Chemical

Place a container (e.g. weighing boat) gently on the balance pan. Close the drafts shields and press ZERO or TARE to reset the balance's display to zero¹. The display should read 0.0000 g. Open the draft shield and remove the tared container. Add the chemical (Fig. 2) and place the container back on the balance. Close the draft shields. Repeat this process until the target mass is reached. Record the mass on the display. The first stable weight displayed will be the most accurate reading.

Remember the target mass is just a target. If you obtain a little bit more, either retain it or put it into the waste container. Do not put the excess chemical back into the reagent bottle.

Dispose of the used weighing boat in the hazardous waste box.

Note: Containers, glassware and pieces of metal can be placed directly on the balance pan.

¹ Some of our balances have separate ZERO and TARE buttons, some have only one ZERO/TARE button. The difference between these two buttons is that the TARE button has an extra feature that

Source of Error	Solution
Leaning on balance table causing vibrations that are transmitted to the balance.	Don't lean on the balance table.
Air currents lifting the balance pan.	Close the draft shields.
Wet samples becoming lighter as moisture evaporates off.	Make sure that the sample is dry before it is weighed.
Weighing warm objects creates a convection current that lifts the balance pan.	Wait 5 min for the object to cool down.
Handling glassware with bare fingers deposits oil on them and increases their mass.	Wear gloves.

Weighing by Difference

The most accurate method to weigh a chemical is weighing by difference. It accounts for the small amount of chemical that remains in the weighing boat after the transfer. To weigh by difference, start by weighing the chemical in a weighing boat. Record the mass of the weighing boat with reagent. Transfer the chemical to the target container. Weigh the
