This is the first of three lab activities on ecology. Over the next three weeks, you will examine the climate and vegetation of three biomes in California, use iNaturalist to compare animal communities in your three locations, and present your findings to the rest of the class.

In this first activity we consider the biomes of California, select three biomes and locations to investigate, and compare climate and vegetation in those regions.

Why Biomes?

As you travel east from the San Joaquin Valley, you pass through several different **biomes (i.e., general habitat types with characteristic plants and animals)**. As you leave the cities and farms of the valley, you enter rolling grasslands with scattered oak trees. As you climb higher in elevation, you see chaparral (shrubland) and areas with denser forests of deciduous trees like oaks and madrone as well as conifers like pine and cedar. As you climb higher, the forest is dominated by fir trees and other conifers. Finally, at the highest elevations of the Sierra Nevada mountains, the trees become sparse and you enter the sub-alpine zone, with low-growing shrubs, grasses, and flowers.

What factors cause these different biomes? Review:

- Campbell Biology in Focus Chapter 40.1, OR [OpenStax Biology 3e Chapter 40.3](#).
- For California-specific information: [this video lecture](#) (30 minutes) by Dr. Matt Cover.

Question 1: At the global scale, what factors and processes explain the distribution of biomes?

On a global scale, temperature and precipitation can explain the distribution of biomes. Rain-shadow effects, Hadley cells, solar energy distribution, elevation, and vegetation help to define biomes all over the world.

Question 2: In California, what factors and processes explain the distribution of biomes?
