---

## Learning Outcomes

- Interpret results from cell physiology experiments involving photosynthesis and cell respiration.
- Use a CO<sub>2</sub> Gas Sensor to measure the amount of carbon dioxide gas consumed or produced by a plant during respiration and photosynthesis.
- Determine the rate of respiration and photosynthesis of a plant.
- Determine and analyze the visible light absorbance spectra of spinach extract.
- Identify the relationship between photosynthesis and cellular respiration.

## Introduction

---

Cellular respiration is the process cells use to convert chemical energy, or glucose, into ATP – the cell's energy molecule. The chemical reaction for this process is:

glucose + oxygen → carbon dioxide + water + ATP

Aerobic respiration is divided into four reactions: **glycolysis**, which occurs in the cytoplasm of the cell; **formation of acetyl Co-A** and the **Kreb's Cycle**, which occur in the mitochondrial matrix; and the **electron transport chain (ETC)**, which occurs in the inner mitochondrial membrane. In this lab we will compare aerobic respiration in germinated beans and dry beans. Study Figure 1 and the model of the mitochondrion in the lab to understand where these reactions take place.
