*Synthesis of the Elements* Giora Shaviv, 2012-04-13 This book describes the origins and evolution of the chemical elements  
 we and the cosmos are made of The story starts with the discovery of the common elements on Earth and their subsequent  
 discovery in space How do we learn the composition of the distant stars How did progress in quantum theory nuclear physics  
 spectroscopy stellar structure and evolution together with observations of stars converge to provide an incredibly detailed  
 picture of the universe How does research in the micro world explain the macro world How does progress in one affect the  
 other or lack of knowledge in one inhibit progress in the other In short Shaviv describes how we discovered the various  
 pieces of the jigsaw that form our present picture of the universe and how we sometimes put these in the wrong place before  
 finding in the right one En route we meet some fascinating personalities and learn about heated controversies Shaviv shows  
 how science lurched from one dogma to the next time and again shattering much of what had been considered solid  
 knowledge until eventually a stable understanding arose Beginning with generally accepted science the book ends in today's  
 terra incognita of nuclear physics astrophysics and cosmology A monumental work that will fascinate scientists philosophers  
 historians and lay readers alike      **Linguistic Attractors** David L. Cooper, 1999 The interdisciplinary linguistic attractor  
 model portrays language processing as linked sequences of fractal sets and examines the changing dynamics of such sets for  
 individuals as well as the speech community they comprise Its motivation stems from human anatomic constraints and  
 several artificial neural network approaches It uses general computation theory to 1 demonstrate the capacity of Cantor like  
 fractal sets to perform as Turing Machines 2 better distinguish between models that simply match outputs emulation and  
 models that match both outputs and internal dynamics simulation and 3 relate language processing to essential computation  
 steps executed in parallel Measure and information theory highlight the key variables driving linguistic dynamics while  
 catastrophe and game theory help predict the possible topologies of language change It introduces techniques to isolate and  
 measure attractors and to interpret their stability and relative content within a system Important results include the  
 capability to distinguish the sequence of related sound changes and to make point to point comparisons of different texts  
 using common metrics Other techniques allow quantifiable ambiguity landscapes illustrating the forces that propel different  
 languages in different directions      **Memory and Mortality in Renaissance England** William E. Engel, Rory
