Science John Michels (Journalist), 2005 A weekly record of scientific progress      *Animal Behavior: Mechanisms, Ecology, Evolution* Lee C. Drickamer, Stephen H. Vessey, Elizabeth Jakob, 2001-07-17 Designed for a one semester introductory course in Animal Behavior Animal behavior is a broad discipline with investigators and contributions from diverse perspectives including anthropology comparative psychology ecology ethology physiology and zoology The authors goal in this textbook is to use evolutionary principles as a unifying theme to provide students exposure to a number of approaches to the field of animal behavior They also demonstrate that the varied perspectives used to study behavior are complementary and often integrated they are not mutually exclusive The subtitle Mechanisms Ecology and Evolution reflects the broad themes that dominate the book      **A History of Bodies, Brains, and Minds** Francisco Aboitiz, 2024-09-17 A panoramic view of the evolution of life on our planet from its origins to humanity s future In A History of Bodies Brains and Minds Francisco Aboitiz provides a brief history of life the brain and cognition from the earliest living beings to our own species The author proceeds from the basic premise that since evolution by natural selection is the process underlying the origin of life and its evolution on earth the brain and thus our minds must also be the result of biological evolution The aim of this book is to narrate how animal bodies came to be built with their nervous systems and how our species evolved with culture technology language and consciousness The book is organized in four parts each delving into a different aspect of evolutionary development Definitions lays the groundwork by discussing the principles of biological evolution and explores the definition and mechanisms of life itself Beginnings describes the origins of life starting from the emergence of the first cells to the development of neurons as the building blocks for brain networks The Rise of Bodies and Brains examines the evolution of animals with bilateral symmetry the emergence of chordates and vertebrates and the expansion and diversification of the vertebrate brain A Singular Ape explores Homo sapiens and our species unique traits such as bipedality tool use culture language communication and consciousness Comprehensive and deeply insightful this book helps us understand our place in the natural world and the cosmos as well as what the future might hold for life on earth      **Ornithology** Michael L. Morrison, Amanda D. Rodewald, Gary Voelker, Melanie R. Colón, Jonathan F. Prather, 2018-09-03 The essential text for ornithology courses this book will leave students with a lifelong understanding and appreciation of the biology and ecology of birds Aves the birds is the wildlife group that people most frequently encounter With over 10 000 species worldwide these animals are part of our everyday experience They are also the focus of intense research and their management and conservation is a subject of considerable effort throughout the world But what are the defining attributes that make a bird a bird Aimed at undergraduate and graduate students Ornithology provides a solid modern foundation for understanding the life and development of birds Written by renowned experts from around the globe this comprehensive textbook draws on the latest research to create an innovative learning experience Moving beyond bones muscle and feathers it provides the core

information needed to build the bird linking anatomy and physiology with ecology and behavior As it reviews the major orders of birds the book highlights their wide diversity and critically evaluates ornithological concepts and theories Incorporating brief biographies of leaders in the field the text describes their contributions in the context of key historical events in bird science Each chapter ends with a summary of the material covered a discussion of potential management and conservation applications and suggested study questions that will stimulate thought and discussion Contributors Peter Arcese George E Bentley Lori A Blanc William M Block Alice Boyle Leonard A Brennan Luke K Butler Zac Cheviron Luis M Chiappe Melanie R Col n Caren B Cooper Robert J Cooper Jamie M Cornelius Carlos Martinez Del Rio John Dumbacher Shannon Farrell Maureen Flannery Geoffrey Geupel Patricia Adair Gowaty Thomas P Hahn Ashley M Heers Fritz Hertel Geoffrey E Hill Matthew Johnson Lukas F Keller Dylan C Kesler Pablo Sabat Kirkwood John Klicka Christopher A Lepczyk Ashley M Long Scott R Loss Graham R Martin John M Marzluff Susan B McRae Michael L Morrison Timothy J O Connell Jen C Owen Marco Pavia Jeffrey Podos Lars Pomara Jonathan F Prather Marco Restani Alejandro Rico Guevara Amanda D Rodewald Vanya G Rohwer Matthias Starck Michael W Strohbach S Ma eika P Sullivan Diego Sustaita Kerri T Vierling Gary Voelker Margaret A Voss Jeff R Walters Paige S Warren Elisabeth B Webb Michael S Webster Eric M Wood Robert M Zink Benjamin Zuckerberg

**Natural Selection in the Wild** John A. Endler, 1986-04-21 Natural selection is an immense and important subject yet there have been few attempts to summarize its effects on natural populations and fewer still which discuss the problems of working with natural selection in the wild These are the purposes of John Endler s book In it he discusses the methods and problems involved in the demonstration and measurement of natural selection presents the critical evidence for its existence and places it in an evolutionary perspective Professor Endler finds that there are a remarkable number of direct demonstrations of selection in a wide variety of animals and plants The distribution of observed magnitudes of selection in natural populations is surprisingly broad and it overlaps extensively the range of values found in artificial selection He argues that the common assumption that selection is usually weak in natural populations is no longer tenable but that natural selection is only one component of the process of evolution natural selection can explain the change of frequencies of variants but not their origins

*Natural Selection and Genetic Drift* Joshua Richardson, 2016 Natural selection is the process which being the most important factor of evolution promotes rising of adaptability and prevents destructive consequences of all other processes The concept of natural selection is a discordant problem of evolutionary human genetics Despite popularity of a hypothesis of neutral evolution the majority of scientists consider that selection has played main role in evolution of species and has generated all bio logical diversity of human populations This book presents research on natural selection and genetic drift The author of the first chapter provides an all embracing macroevolutionary perspective on the processes of the evolution of life and culture on earth The author investigates a complementary form of natural selection that diverges from the traditional form in that it is acting independently of the external environment The

next chapter discusses natural selection and diabetes mellitus The last chapter examines how the genetic drift among native people from South American the Gran Chaco region affects interleukin 1 receptor antagonist variation     Adaptation and Natural Selection George Christopher Williams,2018-10-30 Biological evolution is a fact but the many conflicting theories of evolution remain controversial even today When *Adaptation and Natural Selection* was first published in 1966 it struck a powerful blow against those who argued for the concept of group selection the idea that evolution acts to select entire species rather than individuals Williams s famous work in favor of simple Darwinism over group selection has become a classic of science literature valued for its thorough and convincing argument and its relevance to many fields outside of biology Now with a new foreword by Richard Dawkins *Adaptation and Natural Selection* is an essential text for understanding the nature of scientific debate     **Natural Selection** George Christopher Williams,1992 In this work George C Williams one of evolutionary biology s most distinguished scholars examines the mechanisms and meaning of natural selection in evolution Williams offers his own perspective on modern evolutionary theory including discussions of the gene as the unit of selection clade selection and macroevolution diversity within and among populations stasis and other timely and provocative topics In dealing with the levels of selection controversy he urges a pervasive form of the replicator vehicle distinction Natural selection he argues takes place in the separate domains of information and matter Levels of selection questions consequently require different theoretical devices depending on the domains being discussed In addressing these topics Williams presents a synthesis of his three decades of research and creative thought which have contributed greatly to evolutionary biology in this century     On Evolution Charles Darwin,1996-01-01 Offers an introduction that presents Darwin s theory This title includes excerpts from Darwin s correspondence commenting on the work in question and its significance impact and reception     **Understanding Natural Selection** Michael Ruse,2022-11-17 Explains and defends Darwin s mechanism of natural selection and explores its connections to culture morality and religion     **The Genetical Theory of Natural Selection** Sir Ronald Aylmer Fisher,1958     *Natural Selection* ,     **Choosing Selection** Stephen G. Brush,2009-01-01 Describes the hypothesis that Darwin s natural selection reformulated by R A Fisher J B S Haldane and S Wright in the light of Mendelian genetics is the exclusive mechanism for biological evolution During the 1930s alternatives such as Lamarchism macromutations and orthogenesis were rejected in favor of natural selection acting on small mutations but there were disagreements about the role of random genetic drift in evolution By the 1950s research by T Dobzhansky E B Ford and others persuaded leading evolutionists that natural selection was so powerful that drift was unimportant This conclusion was accepted by most however some biology textbooks and popular articles mentioned drift in the late 1960s     **Natural Selection** Richard G. Delisle,2021-02-27 This book contests the general view that natural selection constitutes the explanatory core of evolutionary biology It invites the reader to consider an alternative view which favors a more complete and multidimensional interpretation It is common to present the 1930 1960 period as characterized by the rise of

the Modern Synthesis an event structured around two main explanatory commitments 1 Gradual evolution is explained by small genetic changes variations oriented by natural selection a process leading to adaptation 2 Evolutionary trends and speciation events are macroevolutionary phenomena that can be accounted for solely in terms of the extension of processes and mechanisms occurring at the previous microevolutionary level On this view natural selection holds a central explanatory role in evolutionary theory one that presumably reaches back to Charles Darwin's *Origin of Species* a view also accompanied by the belief that the field of evolutionary biology is organized around a profound divide theories relying on strong selective factors and those appealing only to weak ones If one reads the new analyses presented in this volume by biologists historians and philosophers this divide seems to be collapsing at a rapid pace opening an era dedicated to the search for a new paradigm for the development of evolutionary biology Contrary to popular belief scholars position on natural selection is not in itself a significant discriminatory factor between most evolutionists In fact the intellectual space is quite limited if not non-existent between on the one hand Darwinists who play down the central role of natural selection in evolutionary explanations and on the other hand non-Darwinists who use it in a list of other evolutionary mechanisms The mechanism-centered approach to evolutionary biology is too incomplete to fully make sense of its development In this book the labels created under the traditional historiography Darwinian Revolution Eclipse of Darwinism Modern Synthesis Post-Synthetic Developments are thus re-evaluated This book will not only appeal to researchers working in evolutionary biology but also to historians and philosophers

**Life's Great Designer** V T Harikumar, 2024-06-13      **The Natural Selection of Populations and Communities** David Sloan Wilson, 1980      *The Origin of Species by Means of Natural Selection* Charles Darwin, 1950      *Natural Selection* J. Phil Gibson, Terri R. Gibson, 2009 In his groundbreaking book *Natural Selection* Charles Darwin explained his theory that evolution is driven by adaptation of species to their environmental surroundings From the tiniest microbe to the largest whale all organisms have changed over vast expanses of time due to the forces of natural selection This new title in the Science Foundations series provides an overview of the processes and causes that drive natural selection and the principles that explain how it operates using numerous diverse organisms as examples *Natural Selection* promotes a solid understanding of how organisms change over the course of generations and how current biodiversity came to be

**Natural Selection as the Process of Accumulating Adaptive Information** Ryan Seamus McGee, 2021 A defining feature of life is its ability to respond to complex conditions by leveraging information about the environment In many respects evolutionary biology is interested in understanding how genetic information changes over time to produce organisms that are exquisitely adapted to their environments The core insight of the modern synthesis is that this adaptive information is acquired by the process of natural selection acting on genetic variation While population genetics has developed a large body of theory regarding how genetic variance changes in the process of evolution we lack correspondingly rich theory describing how adaptive information changes as a consequence of these same dynamics In

Chapter 1 I aim to clarify the sense in which the genome encodes adaptive information about particular environments establish and interpret Shannon's mutual information as the appropriate measure of adaptive genetic information and illustrate how different evolutionary forces shape this information In addition I demonstrate that this view of genetic information is not only of theoretical interest but also practical and useful as a measure of adaptive differentiation Results from classical population genetics suppose that there is a cost of selection measured in terms of substitutional load that limits how much information can be gained by this process In Chapter 2 I test extend and reinterpret this theory to illuminate a rigorous and meaningful relationship between information gain and fitness under very general conditions By reframing the process of natural selection in learning theoretic terms I am able to clarify and formalize the cost of selection in terms of regret a relative measure of load I then establish general bounds on this cost and show that there is indeed a fundamental fitness cost associated with information acquisition by selection These results highlight the centrality of information acquisition to natural selection and the value that information theoretic perspectives have in evolutionary biology Overall this work contributes to an understanding of selection that advances evolutionary theory by synthesizing population genetics information theory and learning theory in modeling the acquisition of adaptive information In the final year of my Ph D the world witnessed the outbreak of the COVID 19 pandemic In response to this crisis I shifted much of my effort to modeling the impact of non pharmaceutical interventions for mitigating disease transmission Infectious diseases spread within a social contact network and many strategies for mitigating spread can be thought of in terms of this network e g social distancing and contact tracing A framework that incorporates realistic contact networks is essential to explore the efficacy of such interventions I developed a flexible stochastic network model that incorporates the structure of data driven contact networks and other extensions that are critical for studying COVID 19 e g pre and asymptomatic transmission hospitalization testing tracing isolation This work led to collaborations with researchers and stakeholders across disciplines In Part 2 I describe how we used the model framework I developed to inform model driven mitigations for schools and workplaces

### **Selection**

Graham Bell, 1996-10-31 The history and diversity of life on earth are testimony to evolutionary processes that extend back to the dawn of time The agent of change and diversification is natural selection acting over long periods of time We might however ask how a process so simple can give rise to the intricate and complex organization of living things and might wonder how a process so long drawn out can be studied at all These questions can be answered by recognizing that selection is a distinctive kind of process whose apparent simplicity can lead to very surprising outcomes For the first time this book brings together the work of laboratories throughout the world showing how experimental evolution provides a solid foundation for our understanding of the living world Selection: The Mechanism of Evolution offers both organismal and molecular biologists and professionals in a wide range of biological disciplines an exciting single source reference that provides extensive documentation of the experimental basis of our understanding of selection This book is also an important

reference for university professors and graduate students doing research in evolution evolutionary and ecological genetics
