Naval Technical Engineering Manual Anchor:

Geomechanics of Marine Anchors Charles Aubeny, 2017-09-18 This book provides a comprehensive guide for the analysis and design of anchor systems used for mooring offshore floating structures. Much of the experience is based on applications toward the offshore oil and gas industry but the substantial potential for offshore renewable energy systems is addressed. The major types of anchors are described with respect to their basic design concept, advantages and limitations, appropriate framework for analysis and observed performance. This book addresses all aspects of anchor behaviour related to anchor design including the installation performance, load capacity, deformation and structural integrity of the anchor itself. Coverage is also provided of appurtenant components of anchor systems in particular of anchor line chain mechanics in the soil and water columns. Much of the material presented represents relatively new developments including several new anchors which have been developed within the last decade so the book will provide a useful compendium of information largely scattered in journals and conference proceedings. This book is intended for engineers engaged in offshore geotechnics and marine engineers involved in mooring system and floating structure design. While the analytical methods presented in this text have a strong theoretical basis, the emphasis is on simplified computational formats accessible to design engineers.

Physico-Mechanical Properties and Treatment Technology of Hazardous Geomaterials, volume II Xianze Cui, Bing Bai, Wenbin Fei, 2023-12-22 This Research Topic is Volume II of a series. The previous volume can be found [here](#). Physico-Mechanical Properties and Treatment Technology of Hazardous Geomaterials. New materials and technologies are emerging in every branch of geotechnical engineering, such as high speed railway subgrade soil improvement and remediation, underground space structure, ground energy storage, energy pile, energy geostructure, energy tunnel, tunnel waterproof engineering and marine engineering. In addition to the common infrastructure construction materials, it also includes the treatment of hazardous geomaterials, resource utilization of industrial wastes, geopolymer materials, contaminated soils related to geoenvironmental engineering as well as other newly developed materials. In recent years, the advancement of new materials has promoted the development of geotechnical engineering and its close intersection with other disciplines. Scholars have done fruitful work but the understanding of many new materials is not very clear. Moreover, the external environment, e.g. heat, water, external force borne by various materials, is becoming more and more complex. The newly developed geotechnical materials involve the coupling actions of multiple fields such as physics, mechanics, chemistry and even biology. Some new technologies and specifications are still developing. For this purpose, it is necessary to investigate the mineral composition and micro structures, physico-mechanical properties, deformation and strength evolution process and constitutive characteristics of various geotechnical materials. The research methods include theoretical description, numerical simulation, laboratory experiments and field tests. The Research Topic aims to bring together Original Research and Review articles on the recent developments in natural geotechnical material improvement, hazardous geomaterials, synthetic
