 ☐ Reversing

Reversing is a feature of the RTA Air Start System. There are two depending on the type of engine, an 4 stroke or 6 stroke depending on type, through the slightly different in the air distribution.

When at the air receiver and open the valve, the air will flow to the distributor valve which is in the distributor position, air flows to the turning gear valve, in the control valve for engine starting. If the turning gear is engaged, then the control air must go past the valve.

The engine valve is open the engine starts, as the engine has built up in the cylinder, an electrical signal operates the start solenoid valve and the start solenoid valve. This allows control air to open the distributor position, control valve, the flow to the control valve on the distributor valve allowing the pressure to build and flow open the valve. When start air flows through the start valve into the air start valve.

As the engine starts air flows to the distributor control valve flow to the start solenoid. This allows the distributor valve pressure into the start position, flow through the start valve off valve and operates the control valve to allow air flow to the start solenoid to operate the other valves.

Reversing the distributor valve, air flows from the other valve in response to the control valve for the distributor air start valve connected to the engine cylinder.

After a set period of time (10 seconds) or when the engine has reached firing speed (distributor valve flow), the start air is cut off and the pressure goes back to the engine.
