Handbook of Immunohistochemistry and in Situ Hybridization of Human Carcinomas M. A. Hayat, 2005-01-31

Immunohistochemistry is the use of specific antibodies to stain particular molecular species in situ. This technique has allowed the identification of many more cell types than could be visualized by classical histology, particularly in the immune system and among the scattered hormone-secreting cells of the endocrine system, and has the potential to improve diagnosis, prognosis, and therapeutic options of cancer. *Handbook of Immunohistochemistry and in Situ Hybridization of Human Carcinomas* discusses all aspects of immunohistochemistry and in situ hybridization technologies and the important role they play in reaching a cancer diagnosis. It provides step-by-step instructions on the methods of additional molecular technologies such as DNA microarrays and microdissection, along with the benefits and limitations of each method. The topics of region-specific gene expression, its role in cancer development, and the techniques that assist in the understanding of the molecular basis of disease are relevant and necessary in science today. This book is the second volume of three planned, individually sold volumes on this topic. Like Volume 1, this book fully explains the principles and applications of modern techniques used in the field of molecular genetics. It will be of particular interest to pathologists and molecular pathologists conducting both academic and/or clinical research. The only book available that translates molecular genetics into cancer diagnosis, the results of each immunohistochemical and in situ hybridization method are presented in the form of color illustrations. Methods discussed were either developed or refined by expert contributors in their own laboratories. [Mapping Abiotic Stress-Tolerance Genes in Plants](#) Richard R.-C. Wang, 2020-12-02. This book presents the latest research results on plant genes controlling tolerance to abiotic stresses, including heat, cold, drought, salt, nitrogen, metals, irradiation, and exogenous phytohormones. The authors report the expression profiles, function, roles in physiological pathways, and chromosomal locations of tolerance genes. The studies involve cytogenetics, genomics, proteomics, and bioinformatics. The information is critical for food security in an environment experiencing global climate changes. Therefore, this book provides a useful reference to students and professionals in plant sciences encompassing genetics, physiology, chemistry, and breeding. *Light in Forensic Science* Giorgia Miolo, Jacqueline L. Stair, Mire Zloh, 2018-04-16. The identification and quantification of material present and collected at a crime scene are critical requirements in investigative analyses. Forensic analysts use a variety of tools and techniques to achieve this, many of which use light. Light is not always the forensic analyst's friend, however, as light can degrade samples and alter results. This book details the analysis of a range of molecular systems by light-based techniques relevant to forensic science, as well as the negative effects of light in the degradation of forensic evidence, such as the breakage of DNA linkages during DNA profiling. The introductory chapters explain how chemiluminescence and fluorescence can be used to visualise samples, and the advantages and limitations of available technologies. They also discuss the limitations of our knowledge about how light could alter the physical nature of materials, for example by breaking DNA.

linkages during DNA profiling or by modifying molecular structures of polymers and illicit drugs The book then explains how to detect analyse and interpret evidence from materials such as illicit drugs agents of bioterrorism and textiles using light based techniques from microscopy to surface enhanced Raman spectroscopy Edited by active photobiological and forensic scientists this book will be of interest to students and researchers in the fields of photochemistry photobiology toxicology and forensic science

Recent Development of Electrospinning for Drug Delivery Romána Zelkó, Dimitrios A. Lamprou, István Sebe, 2020-03-27 Several promising techniques have been developed to overcome the poor solubility and or membrane permeability properties of new drug candidates including different fiber formation methods Electrospinning is one of the most commonly used spinning techniques for fiber formation induced by the high voltage applied to the drug loaded solution With modifying the characteristics of the solution and the spinning parameters the functionality related properties of the formulated fibers can be finely tuned The fiber properties i.e. high specific surface area porosity and the possibility of controlling the crystalline amorphous phase transitions of the loaded drugs enable the improved rate and extent of solubility causing a rapid onset of absorption However the enhanced molecular mobility of the amorphous drugs embedded into the fibers is also responsible for their physical chemical instability This Special Issue will address new developments in the area of electrospun nanofibers for drug delivery and wound healing applications covering recent advantages and future directions in electrospun fiber formulations and scalability Moreover it serves to highlight and capture the contemporary progress in electrospinning techniques with particular attention to the industrial feasibility of developing pharmaceutical dosage forms All aspects of small molecule or biologics loaded fibrous dosage forms focusing on the processability structures and functions
