The American Contractor, 1918 *Regulation of the Heat Shock Response in Escherichia Coli* Eric Guisbert, 2006 All organisms utilize the heat shock response to sense the level of unfolded proteins in the cell and adjust the level of chaperones and proteases accordingly The regulation of the heat shock response has been extensively studied yet there are still unexplained components I report three contributions to our understanding of this regulation First I show that instead of a single chaperone a chaperone network consisting of at least DnaK J and GroEL S is used to sense unfolded proteins Second I provide evidence for an unexpected link between activity control and regulated degradation of sigma32 and suggest that an additional unidentified factor contributes to the regulation of sigma32 activity These results are based on analysis of sigma32 mutants defective in activity regulation Third I demonstrate that Hfq and potentially small RNA binding partners contribute to regulation of sigma32 in at least two distinct ways Hfq represses DnaK translation which in turn leads to an increase in sigma 32 activity Also Hfq participates in a process that we have termed long term adaptation whereby the activity of sigma32 recovers to normal levels following long term chaperone overexpression **Engineering News**, 1893
