Motor Circuits and Motor Symptoms in Dystonia: Translational Approaches from Animal Models to Patients Daniela Popa,Cecile Gallea,2024-04-25

Dystonia is a motor disorder characterized by muscle contractions causing abnormal postures and or movements which are very disabling and painful in severe forms Dystonia is sometimes the only symptom of the disease but it is also present in combination with other motor dysfunctions in many neurological diseases including Parkinson s disease and dyskinetic disorders The possibilities of medical treatment still remain quite limited with side effects The pathophysiologic mechanisms of dystonia concern aberrant communication within brain networks particularly involving the basal ganglia the sensorimotor cortex and the cerebellum Aberrant communication involves a combination of physiological and structural abnormalities involving nodes that relay information between these three main actors thalamus brainstem nuclei cortical nodes However the ways the different loops and nodes embedded in this interconnected complex system participate in explaining the symptoms are unclear which leads to the fact that the etiology of dystonia remains poorly understood This Special Issue aims to publish studies in mammalian and non mammalian phenotypic and genotypic animal models as well as in patients The focus is a better understanding of the pathophysiological mechanisms of dystonia by deciphering how the functional structural abnormalities in motor system can generate or amplify dystonic movements and postures A better understanding of the dysfunction of each region in the network their interactions and their link with the symptoms are important topics to address We welcome researchers and clinicians working on animal models and or patients ideally translational work involving both to participate to this issue and to shed light on novel pathophysiological processes to contribute to a deeper understanding of dystonia as a circuit disorder in relationship with motor symptoms Together this Special Issue will present complementary studies in the human including different dystonia subtypes and animal models including worms fruit flies rodents and others that will allow for the characterization of common physiological processes implicated in dystonia We believe this is an important step to advance in the development of new treatments acting on motor circuits with less adverse side effects than observed with medications
