*The Major Discoveries of Cajal and His Disciples: Consolidated Milestones for the Neuroscience of the XXIst Century*  
Fernando de Castro, Miguel A. Merchán, 2017-04-25

When Santiago Ramón y Cajal started to unravel the fine structure of the nervous system in the last decades of the XIXth century maybe only his unbeatable soul of brave Spaniard imagined that most of the descriptions were scientific truths that lasted to date. Simple histological stainings, curiosity to ameliorate these monocular microscopes, patience for drawing his observations and a rich imaginative open mind: this is the recipe for Cajal's success. His descriptions of connectivity in the nervous system compiled in Cajal's opus magna published in 1904 *Textura del sistema nervioso del hombre y los vertebrados* and 1911 *Histologie du système nerveux* have been corroborated by modern techniques decade after decade. Even more, the main hypothesis that Cajal raised are universally recognised as biological laws today: the neuron theory, the law on the dynamic polarization of the neuron and the chemotropic hypothesis. That is, the nervous system is not a syncytial network but is formed by individual cells; the transmission of the nerve impulses follows a main direction within a given neuron; the axons are guided by chemical substances in a chemotropic way till they form synapses with their targets. Attracted by Cajal's strong personality and scientific success, a number of medical students and doctors joined him in the crusade to explore the nervous system. And the seed planted by the universal savant was really successful. Francisco Tello described interesting aspects of the regeneration of peripheral nerves which are very useful for neuroscientists currently working in this topic. Nicolás Achúcarro significantly contributed to study neuroglia and microglia. Pío del Río Hortega identified two out of the four main nervous cell types: the oligodendrocytes and microglia and proposed an almost still valid classification for the CNS tumours. Fernando de Castro made the first description of arterial chemoreceptors in the carotid body. Rafael Lorente de N was a dominant figure of Neuroscience for decades after the II<sup>nd</sup> World War, first describing the columnar organization of the cerebral cortex well before Mountcastle, Hubbel and Wiesel. Even less recognised co-workers and disciples of Cajal, his brother Pedro Ramón y Cajal, Domingo Sánchez, the neurologist Rodríguez Lafora, protagonised discoveries that are consolidated scientific truths today. Altogether it is difficult if not impossible to find a school in biology contributing in such a fundamental and varied way to the common acervo like the collectively known as Cajal School or Spanish Neurological School. Although the particular way to work of the Maestro, selecting a pleiade of brilliant collaborators with whom to accomplish such a titanic feat, giving them freedom for their studies, has been recognised and confronted to antagonistic systems followed by other relevant scientists and scientific schools, the general recognition of such significant major milestones for Neuroscience and their vigency in the well-marched XXI<sup>st</sup> century is not this. This is the purpose of this Ebook: to remind all these examples of how successful can be the scientific work when it is minacious, constant and performed by brilliant, imaginative and skilled scientists with minimal conditions supporting their efforts.
