electrohydraulic power steering system is developed This work has shown how proportional pressure control valves can be used for Boost curve control and position control and what implications this has on a system level As it turns out the valves add a great deal of time lag and with the high gain from the Boost curve this creates a control challenge The problem can be handled by tuning the Boost gain pressure response and damping and has been effectively shown through simulation and experiments For position control there is greater freedom to design the controller to fit the system The pressure response can be made fast enough for this case and the time lag is much less critical
