Plate Boundaries and Natural Hazards Joao C. Duarte, Wouter P. Schellart, 2016-08-08 The beginning of the new millennium has been particularly devastating in terms of natural disasters associated with tectonic plate boundaries such as earthquakes in Sumatra Chile Japan Tahiti and Nepal the Indian Ocean and the Pacific Ocean tsunamis and volcanoes in Indonesia Chile Iceland that have produced large quantities of ash causing major disruption to aviation In total half a million people were killed by such natural disasters These recurring events have increased our awareness of the destructive power of natural hazards and the major risks associated with them While we have come a long way in the search for understanding such natural phenomena and although our knowledge of Earth dynamics and plate tectonics has improved enormously there are still fundamental uncertainties in our understanding of natural hazards Increased understanding is crucial to improve our capacity for hazard prediction and mitigation Volume highlights include Main concepts associated with tectonic plate boundaries Novel studies on boundary related natural hazards Fundamental concepts that improve hazard prediction and mitigation Plate Boundaries and Natural Hazards will be a

MECS2015 focuses on eight main areas: namely Mechanical Engineering, Automation, Computer Networks, Signal Processing, Pattern Recognition and Artificial Intelligence, Electrical Engineering, Material Engineering and System Design. The conference provided an opportunity for researchers to exchange ideas and application experiences and to establish business or research relations, finding global partners for future collaborations. The conference program was extremely rich, profound and featured high impact presentations of selected papers and additional late-breaking contributions. Interaction of Trypanosoma cruzi with Host Cells Wanderley De Souza,2014-12-10

Trypanosoma cruzi is a pathogenic protozoan of the Trypanosomatidae Family which is the etiological agent of Chagas disease. Chagas disease stands out for being endemic among countries in Latin America affecting about 15 million people. Recently Chagas has become remarkable in European countries as well due to cases of transmission via infected blood transfusion. An important factor that has exacerbated the epidemiological picture in Brazil, Colombia and Venezuela is infection after the oral intake of contaminated foods such as sugar cane juice and bacaba juices. Trypanosoma cruzi is an intracellular protozoan that exhibits a complex life cycle involving multiple developmental stages found in both vertebrate and invertebrate hosts. In vertebrate hosts the trypomastigote form invades a large variety of nucleated cells using multiple mechanisms. The invasion process involves several steps: a) attraction of the protozoan to interact with the host cell surface; b) parasite-host cell recognition; c) adhesion of the parasite to the host cell surface; d) cell signalling events that culminate in the internalization of the parasite through endocytic processes; e) biogenesis of a large vacuole where the parasite is initially located and is also known as parasitophorous vacuole (PV); f) participation of endocytic pathway components in the internalization process; g) participation of cytoskeleton components in the internalization process; h) transformation of the trypomastigote into the amastigote form within the PV; i) lysis of the membrane of the PV; j) multiplication of amastigotes within the host cell in direct contact with cell structures and organelles; k) transformation of amastigotes into trypomastigotes and l) rupture of the host cell releasing trypomastigotes into the extracellular space. The kinetics of the interaction process and even the fate of the parasite within the cell vary according to the nature of the host cell and its state of immunological activation.
