

Front wheel toe-in/adjustment at the factory; however, if further adjustment is required in the future, adjust as shown above. Place the wheel pole in the most straight forward position and measure between the front wheel rim at the extreme front "A" and rear "B" rim locations. Set the distance "A" at the front to be between zero and 5/8 of an inch (less than the distance "B" at the rear). To do this, first the exact center line of the wagon. Make the distance from the center line to the front and rear of the rim equal in

both wheels and then adjust each wheel to have 5/16 of an inch less distance between the front edge of the rim and the center line of the wagon. To make this adjustment, loosen four nuts in the toe rod and turn the toe rod in or out of the hole. When desired adjustment is reached by moving the rods in, checked both sides, tighten four bolts.

CAUTION Do not adjust for maximum toe-in. Too much toe-in will cause excessive tire wear.

EXTRA EQUIPMENT

BALL AND SOCKET FITCH

A ball and socket fitch, shown at right, is available as an extra and attaches to the pole with two large bolts, nuts, and lock washers.

Auxiliary springs are available for the Wagon equipped with log isolators, and install the fitch to carry a heavy load with greater stability. These springs are designed to compress and compress the isolator type into its own axle, the spring under that axle is in compression against the load from going down. The spring under the opposite side is in tension, and pulls down on that side of the wagon, greatly stabilizing the load being carried.

The use of these springs to increase the tipping resistance of the Wagon to about 3000 lbs. The overall capacity of the wagon is not increased by the use of these springs.

Spring isolators on front and back axle should be assembled as instructed on page 14, Step 3, with the springing spring isolator on the same side to prevent twisting from front to back when under load.

Small auxiliary springs under both ends of each isolator, using air-line hose lines.

Secure both securing chains to permit installation of isolator plate "A".

Locate casting "B" in the front axle over the lower bolt of the spring housing.

Place U-bolt over casting "B" to secure and support in raised position while the straight tail of the spring forcing the wheel is inserted in a fixed position under U-bolt into top axle plate "B." Roll the spring in this position, place the isolator plate "A" on top and insert the rear end of the plate into the isolator.

It is necessary to pry the isolator plate "B" inward against spring pressure until the lower hole in the isolator plate lines up with the holes in the isolator. Secure plate, spring and chains with long carriage bolts, lock washers and nuts.

Install the lower axle plate "C" and secure with lock washers and two sets, 3/16" x 1/2". The same assembly procedure is used for the rear plate using springs, except it is unnecessary to locate top axle plate "B" with solid face of plate inward, the same distance from the center line of wagon as the front axle.

When properly assembled, the front right-hand spring will lean outward of the top when not under load; the left-hand spring will lean slightly forward. Under load the springs will straighten.
