Tests and Adjustments

Ground Speed Adjustment

J406 Shown

J445 Shown

When the operator presence control bar (A) is held back against the Mohtaman™ drive handle (B), and the drive handle is moved forward, the drive unit is engaged. Pushing the drive handle further forward increases the ground speed. Pulling the drive handle back decreases ground speed and will ultimately disengage the drive unit.

This occurs because the drive handle is connected to the traction drive belt tensioning mechanism by a cable (C) that runs under the left side of the handle assembly. As the drive belt wears, belt tension decreases, and ground speed at a given drive handle position changes.

To adjust the ground speed as it relates to drive handle position, the drive cable (C) must be adjusted.

Caution: Avoid Injury! Do not make cable adjustment with the engine running.

Note: Descriptions are based on the operator facing forward.

If the cable or drive belt have been replaced the initial cable setting is to leave 1/20-in (1/2 inch) of exposed threads above the Pumphistol block.

Note: After adjustment the drive system should pull the mower through mowing conditions, and disengage when drive handle is pulled all the way back.

Adjustment:

J406 Shown

J445 Shown

• Locate the drive cable (C) and Pumphistol adjuster (D) under the left side of the handle assembly.

• Rotate the Pumphistol adjuster (counter-clockwise) to increase belt tension (drive speed), or clockwise to decrease belt tension (drive speed), as desired.

• Start engine and check that drive system operates properly and pulls mower in cutting condition when drive handle is engaged.

• If drive system does not disengage when drive handle is pulled all the way back, adjust Pumphistol clockwise to decrease belt tension. Start engine and check for proper disengagement.
