Another thing: When you're crawling or walking through the brush, make a mental note to make sure you don't get the flash suppressor caught in a bush. It catches easy, y'know.

All the way . . . Educate your sixth sense to flip the selector lever all the way across to get from Safe to Automatic. In an ambush situation, you just might flip it only half way — to Semiautomatic — when you'll need all the fire you can get.

You might practice flipping it all the way till this becomes second nature.

All in all, this M16A1 is a real sweet number. It'll stay that way as long as you treat it like one.

Combat types can't emphasize this enough: Clean the gas port in the bolt carrier group every day — and take it real easy with the lub. Dirt and powder-fouling — plus an overload of lub oil — will give you a sluggish rifle. . . . Number 10 There is a combat situation!

So, when you get your baby stripped for cleaning, like it says in para 3-9 in TM 9-1005-249-12 (1968) with Ch. 1, take an extra 5 seconds to get at the gas port hole down there at the front end of the gas tube. Like so:

1. Work a worn, fine brush full of bore cleaner around the inside the hole.

Make sure you get the metal end of the brush in all the way — right into the last turn of the hole where the gas tube is seated in the carrier key — and then turn it to loosen the mud. That last 1/4 in. is there is the most neglected part in most direct rifles.

2. Then use a pipe cleaner or the like to push the gunk out of the port. Don't use wire, though, or you might scratch the tube and set up serious trouble later on.

FOR INFO: DON'T USE PIPE CLEANER

NOW IN YOUR TM

3. Use another pipe cleaner — or an oldy if the working is around — to dry the tube out well as you can.

4. Now doublecheck your job. Remove the bolt. Then stick the carrier body into the receiver slide-way and push the carrier back and forth slowly to check that the carrier key and gas tube line up OK. The carrier should move freely . . . and should go all the way without friction. If it won't go all the way without a struggle, you've got some more cleaning to do. But, if it binds, turn the weapon or the rifle.

Here's the Pitch: The front end of the gas tube is self-cleaning, thanks to the hot gases and high pressure from the barrel. But, if you don't keep the other end clear — the gas tube area where it mates with the carrier key inside the receiver — brother! You've got to clean the area with elbow grease to prevent stoppages, hear?

Now, when you come to lubing, stick to the dope in the lub guide (para 12-14 of this pamphlet).

Ehrhart, 2015-11-06 Operations in Afghanistan frequently require United States ground forces to engage and destroy the enemy at ranges beyond 300 meters These operations occur in rugged terrain and in situations where traditional supporting fires are limited due to range or risk of collateral damage With these limitations the infantry in Afghanistan require a precise lethal fire capability that exists only in a properly trained and equipped infantryman While the infantryman is ideally suited for combat in Afghanistan his current weapons doctrine and marksmanship training do not provide a precise lethal fire capability to 500 meters and are therefore inappropriate Comments from returning non commissioned officers and officers reveal that about fifty percent of engagements occur past 300 meters The enemy tactics are to engage United States forces from high ground with medium and heavy weapons often including mortars knowing that we are restricted by our equipment limitations and the inability of our overburdened soldiers to maneuver at elevations exceeding 6000 feet Current equipment training and doctrine are optimized for engagements under 300 meters and on level terrain There are several ways to extend the lethality of the

infantry A more effective 5.56 mm bullet can be designed which provides enhanced terminal performance out to 500 meters A better option to increase incapacitation is to adopt a larger caliber cartridge which will function using components of the M16 M4 The 2006 study by the Joint Service Wound Ballistics Integrated Product Team discovered that the ideal caliber seems to be between 6.5 and 7 mm This was also the general conclusion of all military ballistics studies since the end of World War I In My Time Charles Willingham,2007-06 Author Charles E Willingham always said he would achieve
