

## Lab 53: Fertilization and Early Development

### Introduction

Fertilization is the process by which the nuclei of an egg and a sperm cell fuse together to form a new cell, the zygote. This process is essential for the development of a new organism.

In sexually reproducing organisms, the egg and sperm cells are produced by meiosis, a process that results in the formation of four haploid cells from a single diploid cell. These cells are then fertilized to form a diploid zygote. The zygote then undergoes cleavage, a series of cell divisions that result in the formation of a blastocyst, which is the early stage of development.

During the fertilization process, the egg and sperm cells fuse to form a zygote. The zygote then undergoes cleavage, a series of cell divisions that result in the formation of a blastocyst, which is the early stage of development. The blastocyst then implants itself in the uterine wall, where it will develop into a fetus.

### Purpose

The purpose of this lab is to observe the process of fertilization and to describe the early stages of development.

### Objectives

1. Describe the process and components of fertilization.
2. Describe and illustrate the early stages of development.
