**Advanced Theory of Mechanisms and Machines** M.Z. Kolovsky, A.N. Evgrafov, Yu.A. Semenov, A.V. Slousch, 2012-09-03 This book is based on a lecture course delivered by the authors over a period of many years to the students in mechanics at the St Petersburg State Technical University the former Leningrad Polytechnic Institute The material differs from numerous traditional text books on Theory of Machines and Mechanisms through a more profound elaboration of the methods of structural geometric kinematic and dynamic analysis of mechanisms and machines consisting in both the development of well known methods and the creation of new ones that take into account the needs of modern machine building and the potential of modern computers The structural analysis of mechanisms is based on a new definition of structural group which makes it possible to consider closed structures that cannot be reduced to linkages of Assur groups The methods of geometric analysis are adapted to the analysis of planar and spatial mechanisms with closed structure and several degrees of movability Considerable attention is devoted to the problems of configuration multiplicity of a mechanism with given input coordinates as well as to the problems of distinguishing and removing singular positions which is of great importance for the design of robot systems These problems are also reflected in the description of the methods of kinematic analysis employed for the investigation of both open tree type structures and closed mechanisms Constant-Mach-number Simulation of Critical Flight Loads on High-velocity Projectile Fuzes Frank T. Buckley, 1969 A study was made to determine the most effective means of using a constant Mach number wind tunnel to reproduce flight loads thermal and mechanical that would most likely cause failure of high velocity projectile fuzes It was concluded that the tunnel Mach number should approximate the projectile launch value to simulate the mechanical loads at launch and shortly thereafter and that the flight aerodynamic heating should be simulated throughout the test to obtain proper fuze heating The latter is accomplished by duplicating the flight stagnation temperature and maintaining a tunnel stagnation pressure dependent on flight Mach number and stagnation pressure Rules were developed pertaining to the constant Mach number simulation of the flight aerodynamic heating for fuze shapes that may be classified as sharp spherically capped or flat faced cones Author
