

Algebra: A5-7 Model Functions

• Finding model functions for data using technology

[Summary](#) [Learn](#) [Solve](#) [Explain](#) [Answers](#)

Summary

If a relation shows a pattern, we can express it as a formula. Sometimes a relation shows an approximation to a pattern, though with some deviation from the actual pattern. In that case we can write a formula for the relation that it approximates. This is called a model relation. As such relations are generally functions, we more often call them model functions.

If we enter data as a set of ordered pairs into a graphics calculator or spreadsheet, it can find a formula for the model function of the type we specify. We can specify a linear function, a quadratic function, an exponential function or a function of various other types.

Along with the formula, it will give a value for r , the correlation coefficient, or r^2 . These indicate how close the data is to the model function.

To choose the most appropriate function type (linear, power or whatever), for each type, we consider three criteria: the value for r^2 , the likelihood that the situation the data came from would produce that type of relation, and whether the model function would produce appropriate values of the dependent variable for values of the independent variable higher or lower than in our data.

When you make a cup of coffee, it's hot. If you let it sit for a while, it gets cooler, eventually approaching room temperature. If we recorded the temperature difference between the coffee and the room every minute, we might get a relation something like the one in the table below. (It is the difference between the temperature of the coffee and room temperature, and t is the time since making the coffee.)

Steenrod Squares in Spectral Sequences William M. Singer, 2006 This book develops a general theory of Steenrod operations in spectral sequences It gives special attention to the change of rings spectral sequence for the cohomology of an extension of Hopf algebras and to the Eilenberg Moore spectral sequence for the cohomology of classifying spaces and homotopy orbit spaces In treating the change of rings spectral sequence the book develops from scratch the necessary properties of extensions of Hopf algebras and constructs the spectral sequence in a form particularly suited to the introduction of Steenrod squares The resulting theory can be used effectively for the computation of the cohomology rings of groups and Hopf algebras and of the Steenrod algebra in particular and so should play a useful role in stable homotopy theory Similarly the book offers a self contained construction of the Eilenberg Moore spectral sequence in a form suitable for the introduction of Steenrod operations The corresponding theory is an effective tool for the computation of t
