*Unified Separation Science* J. Calvin Giddings, 1991-01-16 Unifies the complex welter of techniques used for chemical separations by clearly formulating the concepts that are common to them The mass transport phenomena underlying all separation processes are developed in a simple physical mathematical form The limitations and optimum performance of alternative separation techniques and the factors enhancing and limiting separation power can thus be described and explored Generously illustrated and contains numerous exercises Long awaited in the scientific community it breaks new ground in understanding separation processes [Reactivity of Molecular Solids](#) Elena Boldyreva, Vladimir

**Modeling Loop Flexibility Via Conformational Ensembles** Sergio E. Wong, 2006 Phosphorylation was studied at length because it shifts the conformational ensemble population distribution Since simulations of phosphorylated residues remain largely unexplored I explored the suitability of current solvation models to properly react to a phosphate moiety Hydrogen bonding of phosphorylated residues explained phosphorylation induced shifts in  $^3J_{NH-C\alpha H}$  coupling constants for short tetrapeptides this underscored the need for the solvation model to modulate hydrogen bond strength A distance

dependent dielectric performed consistently poorly in our simulations while a Generalized Born treatment and the explicit water models TIP3P TIP4P and SPC E provided satisfactory results In addition the role of polarizability in interactions of phosphorylated residues was explored Ab initio calculations made it clear polarizability contributes to phosphorylated residues preference for arginine over lysine as salt bridge partners It was also found the protonated phosphate moiety 1 and the carboxylate ion have similar interaction energies with arginine and lysine which may explain why carboxylic acids can sometimes substitute for phosphorylation

*Spectroscopy and Modeling of Biomolecular Building Blocks* Jean-Pierre Schermann, 2008 Spectroscopy and Modeling of Biomolecular Building Blocks presents an overview of recent advances in the intertwining of the following research fields photon and electron spectroscopy quantum chemistry modelling and mass spectrometry The coupling of these disciplines offers a new point of view to the understanding of isolated elementary building blocks of biomolecules and their assemblies It allows the unambiguous separation between intrinsic properties of biomolecular systems and those induced by the presence of their environment The first chapters provide background in modelling I frequency resolved spectroscopy using microwave infrared and UV photons time resolved spectroscopy in the femtosecond domain and energy resolved electron spectroscopy II and production of gas phase neutral and ionic biomolecular species mass spectrometry ion mobility and BIRD techniques III Chapter IV is devoted to case studies of gas phase experimental investigations coupled to quantum or classical calculations The topics are structural studies of nucleobases and oligonucleotides peptides and proteins sugars neuromolecules non covalent complexes chiral systems interactions of low energy electrons with biomolecules in the radiation chemistry context and very large gas phase biomolecular systems The fifth chapter concerns the link between gas phase and liquid phase Different treatments of solvation are illustrated through examples pointing out the influence of progressive addition of water molecules upon properties of nucleobases peptides sugars and neuromolecules Offer a new perspective to the understanding of isolated elementary building blocks of bio molecules Includes case studies of experimental investigations coupled to quantum or classical calculations
