Planning the Initial Interview

Abstract—The authors examined the effects of a 12-week, 100% body weight (BW) resistance training program on the muscle strength and body composition of 10 sedentary, middle-aged men. The subjects were randomly assigned to either a control group (CON) or a resistance training group (RT). The RT group performed a 12-week, 100% BW resistance training program. The CON group performed no resistance training. The RT group showed significant increases in muscle strength and body composition compared to the CON group. The results suggest that a 12-week, 100% BW resistance training program can improve muscle strength and body composition in sedentary, middle-aged men.
