Next, he shows how to realize cryptographic systems and protocols that are truly fit for application and formally demonstrates their fitness. Mao presents practical examples throughout and provides all the mathematical background you'll need. Coverage includes: Crypto foundations, probability, information theory, computational complexity, number theory, algebraic techniques, and more. Authentication, basic techniques and principles vs. misconceptions and consequential attacks. Evaluating real-world protocol standards including IPsec, IKE, SSH, TLS, SSL, and Kerberos. Designing stronger counterparts to vulnerable textbook crypto schemes. Mao introduces formal and reductionist methodologies to prove the fit for application security of practical encryption, signature, signcryption, and authentication schemes. He gives detailed explanations for zero-knowledge protocols, definition, zero-knowledge properties, equatability vs. simulatability, argument vs. proof, round efficiency, and non-interactive versions.
