Crossing the Boundaries of Life Karl S. Matlin, 2022-05-10 The difficulty of reconciling chemical mechanisms with the functions of whole living systems has plagued biologists since the development of cell theory in the nineteenth century As Karl Matlin argues in *Crossing the Boundaries of Life* it is no coincidence that this longstanding knot of scientific inquiry was loosened most meaningfully by the work of a cytologist the Nobel laureate G nter Blobel In 1975 using an experimental setup that did not contain any cells at all Blobel was able to synthesize proteins to theorize how proteins in the cell communicate spatially an idea he called signal hypothesis Over the next 20 years Blobel and other scientists were able to dissect this process into its precise molecular details For elaborating his signal concept into a process he termed membrane topogenesis the idea that each protein in the cell is synthesized with an address that directs the protein to its correct destination within the cell Blobel was awarded the Nobel Prize in Physiology or Medicine in 1999 Matlin argues that Blobel s investigative strategy and its subsequent application addressed the fundamental unresolved dilemma that had bedeviled biology from its very beginning allowing biology to overcome the barrier that had long blocked progress toward mechanistic explanations of life *Crossing the Boundaries of Life* thus uses Blobel s research and life story to shed light on the importance of cell biology for twentieth century science illustrating how it propelled the development of adjacent disciplines like biochemistry and molecular biology
