Andrews, 2015-01-16 Covers modern photonics accessibly and discusses the basic physical principles underlying all the applications and technology of photonics This volume covers the basic physical principles underlying the technology and all applications of photonics from statistical optics to quantum optics The topics discussed in this volume are Photons in perspective Coherence and Statistical Optics Complex Light and Singular Optics Electrodynamics of Dielectric Media Fast and slow Light Holography Multiphoton Processes Optical Angular Momentum Optical Forces Trapping and Manipulation Polarization States Quantum Electrodynamics Quantum Information and Computing Quantum Optics Resonance Energy Transfer Surface Optics Ultrafast Pulse Phenomena Comprehensive and accessible coverage of the whole of modern photonics Emphasizes processes and applications that specifically exploit photon attributes of light Deals with the rapidly advancing area of modern optics Chapters are written by top scientists in their field Written for the graduate level student in physical sciences Industrial and academic researchers in photonics graduate students in the area College lecturers educators policymakers consultants Scientific and technical libraries government laboratories NIH **Methods of Molecular Quantum Mechanics** R. McWeeny, 1989 Since this book was first published 20 years ago there have been remarkable advances in molecular quantum mechanics The traditional methods expounded in the first edition have been absorbed into the growing field of computational chemistry but the whole fabric of the subject has also changed under the impact of techniques originating in theoretical physics Consequently besides

rewriting much of the original text it has been necessary to add an almost equal amount of completely new material this covers second quantization and diagrammatic perturbation theory symmetric and unitary group methods new forms of valence bond theory dynamic properties and response propagator and equation of motion techniques and the theory of intermolecular forces Problems with hints on solutions appear at the end of each chapter and form a valuable supplement to the text Like the first edition this is a teaching book which follows a deductive step by step path from basic principles up to the current frontiers of research Although aimed primarily at graduate students and their teachers it should be standard reference for all who come in contact with modern theories of the electronic structure and properties of molecules The last twenty years have seen remarkable advances in molecular quantum mechanics The traditional methods expounded in the first successful edition of this book have been implemented on a grand scale In the Second Edition Mcweeny has completely revised the text and has added a wealth of new material and example problems

Principles of Nonlinear Optical Spectroscopy Shaul Mukamel, 1995 Nonlinear optical interaction of laser fields with matter provide powerful spectroscopic tools for the understanding of microscopic interactions and dynamic processes This volume provides a systematic account of a wide class of nonlinear spectroscopic techniques in time domain and frequency domain for researchers and graduate students in the field Current active research areas such as ultrafast time domain techniques the interplay of phase coherence in the matter and the coherence properties of the radiation field experiments involving phase controlled pulse sequences and cooperative effects in nanostructures are emphasized Annotation copyright by Book News Inc Portland OR
