Government Accountability Office, 2012-08-13 The effect of CMS s revised community model on payment accuracy varied for the high risk groups studied Specifically compared with the current community model the revised community model slightly reduced the accuracy of MA payment adjustments for beneficiaries with multiple chronic conditions by 164 or about 1 percent of average actual expenditures For beneficiaries with low income the accuracy of the revised and the current community models was similar estimates differed by 5 or less than 0.1 percent of average actual expenditures For beneficiaries with dementia the revised community model substantially improved the accuracy of MA payment adjustments by 2,674 or about 16 percent of average actual expenditures Compared with the general new enrollee model the C SNP new enrollee model substantially improved the accuracy of MA payment adjustments for new enrollees with C SNP conditions but considerable inaccuracy in the model s estimates remains for certain groups The amount by which accuracy improved was similar across 14 severe or disabling chronic conditions about 2,500 This reflects the design of the C SNP new enrollee model which increases expenditure estimates from the general new enrollee model by an amount that does not depend on beneficiaries medical conditions However the C SNP new enrollee model still underestimated expenditures for C SNP eligible new enrollees on

average by about 1 500 and by more than 15 000 for beneficiaries who had certain conditions such as end stage liver disease or stroke The C SNP new enrollee model s results varied depending on the number of severe or disabling conditions the beneficiary had Specifically the model reduced the accuracy of estimated expenditures for new enrollees with only 1 severe or disabling condition by about 62 percent of average actual expenditures but improved the accuracy for those with 4 or more conditions by about 8 percent However the C SNP new enrollee model still underestimated expenditures for beneficiaries with 4 or more conditions by over 20 000 Accurate risk adjustment is particularly important for certain high risk beneficiary groups that are more challenging and costly to treat and may benefit particularly from the coordination of care MA plans can provide The decision to implement the revised community model that adjusts for dementia will depend on CMS s assessment of the advantages of more accurate payment adjustment for beneficiaries with dementia compared with the potential increase in the discretionary coding of dementia because of revised coding guidelines for Alzheimer s disease dementia published in April 2011 Additionally while the introduction of the C SNP new enrollee model improved the accuracy of payment adjustments for eligible new enrollees on average the model still considerably underestimated expenditures for certain groups which could place plans that disproportionately enroll beneficiaries in these groups at a relative financial disadvantage In its comments on a draft of this report CMS suggested that GAO assess the overall accuracy of the current risk adjustment model GAO did not assess overall model accuracy because such an analysis was not within the scope of GAO s work and would have required additional data
