

Question 1:

A nurse is caring for a client in the emergency department who has a preliminary diagnosis of a transient ischemic attack (TIA). Which of the following diagnostic testing should the nurse anticipate the provider to prescribe?

- A. Computerized tomography angiography (CTA) 61% Most Selected ✓
- B. Complete blood count (CBC) 13% ✗
- C. Prothrombin time (PT) 19% ✗
- D. Transesophageal echocardiogram (TEE) 5% ✗

Answer and Explanation

**Choice A:**

**Computerized tomography angiography (CTA)** This is a likely diagnostic test that the provider may prescribe. CTA uses computed tomography (CT) imaging to visualize the blood vessels in the brain and neck. It can help identify areas of stenosis, occlusion, or other abnormalities in the blood vessels that may contribute to the TIA symptoms.

**Choice B:**

**Complete blood count (CBC)** A complete blood count (CBC) is a routine laboratory test that assesses various components of blood, such as red blood cells, white blood cells, and platelets. While it may not be specific to diagnosing a transient ischemic attack (TIA), it can help evaluate for underlying conditions such as anemia or thrombocytosis that could contribute to TIA symptoms or increase the risk of stroke.

**Choice C:**

**Prothrombin time (PT)** is a laboratory test that evaluates the clotting ability of blood and is typically used to monitor anticoagulant therapy. While abnormal coagulation parameters may be associated with certain conditions that predispose to TIA (such as atrial fibrillation), PT alone is not a specific diagnostic test for TIA.
