

MEDICAL TRANSCRIPTION

Medical transcription, also known as MT, is an allied health profession, which deals in the process of transcription, or converting voice-recorded reports dictated by physicians or other healthcare professionals, into text format.

Medical transcription is part of the healthcare industry that renders and edits doctor dictated reports, procedures, and notes in an electronic format in order to create files representing the treatment history of patients. Health practitioners dictate what they have done after performing procedures on patients and MTs transcribe the oral dictation and/or edit reports that have gone through speech recognition software.

Pertinent up-to-date, confidential patient information is converted to a written text document by a medical transcriptionist (MT). This text may be printed and placed in the patient's record and/or retained only in its electronic format. Medical transcription can be performed by MTs who are employees in a hospital or who work at home as telecommuting employees for the hospital; by MTs working as telecommuting employees or independent contractors for an outsourced service that performs the work offsite under contract to a hospital, clinic, physician group or other healthcare provider; or by MTs working directly for the providers of service (physians or their group practices) either onsite or telecommuting as employees or contractors. Hospital facilities often prefer electronic storage of medical records due to the sheer volume of hospital patients and the accompanying paperwork. The electronic storage in their database gives immediate access to subsequent departments or providers regarding the state of a care to-date, status, of previous or present medications, notification of allergies, and establishes a history on the patient to facilitate healthcare delivery regardless of geographical distance or location.

The term transcript or "report" as it is more commonly called, is used as the name of the document (electronic or physical hard-copy) which results from the medical transcription process, normally in reference to the healthcare professional's specific encounter with a patient on a specific date of service. This report is referred to by many as a "medical record". Each specific transcribed record or report, with its own specific date of service, is then merged and becomes part of the larger patient record commonly known as the patient's medical history. This record is often called the patient's chart in a hospital setting.

Medical transcription encompasses the MT performing document typing and formatting functions according to an established criteria or format, transcribing the spoken word of the patient's care information into a written, easily readable form. MT requires correct spelling of all terms and words, (occasionally) correcting medical terminology or dictation errors. MTs also edit the transcribed documents, print or return the completed documents in a timely fashion. All transcription reports must comply with medical-legal concerns, policies and procedures, and laws under patient confidentiality.

In transcribing directly for a doctor or a group of physicians, there are specific formats and report types used, dependent on that doctor's specialty or practice, although history and physical exams or consults are mainly utilized. In most of the off-hospital sites, independent medical practices perform consultations as a second opinion, pre-surgical exams, and as IMEs (Independent Medical Examinations) for liability insurance or disability claims. Some private practice family doctors choose not to utilize a medical transcriptionist, preferring to keep their patient's records in a handwritten format, although this is not true of all family practitioners.

Currently, a growing number of medical providers send their dictation by digital voice files, utilizing a method of transcription called speech or voice recognition. Speech recognition is still a nascent technology that loses much in translation. For dictators to utilize the software, they must first train the program to recognize their spoken words. Dictation is read into the database and the program continuously "learns" the spoken words and phrases.
