Virtualization for Security John Hoopes,2009-02-24 One of the biggest buzzwords in the IT industry for the past few years virtualization has matured into a practical requirement for many best practice business scenarios becoming an invaluable tool for security professionals at companies of every size In addition to saving time and other resources virtualization affords unprecedented means for intrusion and malware detection prevention recovery and analysis Taking a practical approach in a growing market underserved by books this hands on title is the first to combine in one place the most important and sought after uses of virtualization for enhanced security including sandboxing disaster recovery and high availability forensic analysis and honeypotting Already gaining buzz and traction in actual usage at an impressive rate Gartner research indicates that virtualization will be the most significant trend in IT infrastructure and operations over the next four years A recent report by IT research firm IDC predicts the virtualization services market will grow from 5.5 billion in 2006 to 11.7 billion in 2011 With this growth in adoption becoming increasingly common even for small and midsize businesses security is becoming a much more serious concern both in terms of how to secure virtualization and how virtualization can serve critical security objectives Titles exist and are on the way to fill the need for securing virtualization but security professionals do not yet have a book outlining the many security applications of virtualization that will become increasingly important in their job requirements This book is the first to fill that need covering tactics such as isolating a virtual environment on the desktop for application testing creating virtualized storage solutions for immediate disaster recovery and high availability across a network migrating physical systems to virtual systems for analysis and creating complete virtual systems to entice hackers and expose potential threats to actual production systems About the TechnologiesA sandbox is an isolated environment created to run and test applications that might be a security risk

Recovering a compromised system is as easy as restarting the virtual machine to revert to the point before failure. Employing virtualization on actual production systems rather than just test environments yields similar benefits for disaster recovery and high availability. While traditional disaster recovery methods require time-consuming reinstallation of the operating system and applications before restoring data, backing up to a virtual machine makes the recovery process much easier, faster, and efficient. The virtual machine can be restored to the same physical machine or an entirely different machine if the original machine has experienced irreparable hardware failure. Decreased downtime translates into higher availability of the system and increased productivity in the enterprise. Virtualization has been used for years in the field of forensic analysis, but new tools, techniques, and automation capabilities are making it an increasingly important tool. By means of virtualization, an investigator can create an exact working copy of a physical computer on another machine, including hidden or encrypted partitions, without altering any data, allowing complete access for analysis. The investigator can also take a live snapshot to review or freeze the target computer at any point in time before an attacker has a chance to cover his tracks or inflict further damage.

Networking -- ICN 2005 Petre Dini, Pascal Lorenz, 2005-03-31 The International Conference on Networking ICN 2005 was the fourth conference in its series aimed at stimulating technical exchange in the emerging and important field of networking. On behalf of the International Advisory Committee, it is our great pleasure to welcome you to the proceedings of the 2005 event. Networking faces dramatic changes due to the customer-centric view, the venue of the next generation networks paradigm, the push from ubiquitous networking, and the new service models. Despite legacy problems, which researchers and industry are still discovering and improving, the state of the art horizon has revealed new challenges that some of the authors tackled through their submissions. In fact, ICN 2005 was very well perceived by the international networking community. A total of 651 papers from more than 60 countries were submitted, from which 238 were accepted. Each paper was reviewed by several members of the Technical Program Committee. This year, the Advisory Committee revalidated various accepted papers after the reviews had been incorporated. We perceived a significant improvement in the number of submissions and the quality of the submissions. The ICN 2005 program covered a variety of research topics that are of current interest, starting with Grid networks, multicasting, TCP optimizations, QoS, and security, emergency services, and network resiliency. The Program Committee selected also three tutorials and invited speakers that addressed the latest research results from the international industries and academia, and reports on findings from mobile satellite and personal communications related to 3rd and 4th generation research projects and standardization.
