### 1.1 The Phospholipids

The Phospholipids are the primary components of the cell membrane which provides basic support to the body. Phospholipids are also the major structural components of the cell's organelles. Phospholipids are made up of two main components: hydrophilic heads and hydrophobic tails. The hydrophilic heads are water-soluble, while the hydrophobic tails are not. The hydrophilic heads are made up of a phosphate group and a glycerol backbone. The hydrophobic tails are made up of two fatty acid chains.

Due to the hydrophilic nature of the hydrophilic heads, they tend to interact with water. This interaction is what gives the cell membrane its fluidity. The hydrophobic tails, on the other hand, tend to interact with each other, forming a barrier that prevents water from passing through. This is why the cell membrane is so effective at controlling what enters and leaves the cell.

Phospholipids are also involved in a variety of other processes. For example, they are involved in the transport of molecules across the membrane. They are also involved in the regulation of the cell's internal environment. In addition, they are involved in the formation of the cell's internal structure. Rothfield, 2014-06-28 *Structure and Function of Biological Membranes* explains the membrane phenomena at the molecular level through the use of biochemical and biophysical approaches The book is an in depth study of the structure and function of membranes It is divided into three main parts The first part provides an overview of the study of the biological membrane at the molecular level Part II focuses on the detailed description of the overall molecular organization of membranes The third part covers the relationship of the molecular organization of membranes to specific membrane functions discusses catalytic membrane proteins presents the role of membranes in important cellular functions and looks at the membrane systems in eukaryotic cells Biochemists cell physiologists biologists researchers and graduate and postdoctoral students in the field of biology will find the text a good reference material      **The Membranes of Cells** Philip Yeagle, 1987-07-28 The lipids of cell membranes Membrane models and model membranes Lipid properties in membranes Cholesterol and cell membranes Membrane proteins Lipid protein interactions in biological membranes and reconstitution of membrane function Transport Membrane fusion The metabolism of membrane lipids Membrane biogenesis      *The Plant Plasma Membrane* Christer Larsson, Ian M. Moller, 2012-12-06 The plasma membrane forms the living barrier between the cell and its surroundings For this reason it has a wide range of important functions related to the regulation of the composition of the cell interior and to communication with the cell exterior The plasma membrane has therefore attracted a lot of research interest Until the early 1970 s it was only possible to study the plasma membrane in situ its structure e g by electron microscopy and its function e g by uptake of radioactively labeled compounds into the intact cell or tissue The first isolation of plant protoplasts by enzymatic digestion of the cell wall in the early 1970 s was an important step forward in that

it provided direct access to the outer surface of the plasma membrane More importantly T K Hodges and R J Leonard in 1972 published the description of a method by which a fraction enriched in plasma membranes could be isolated from plant tissues using sucrose gradient centrifugation As a result the 1970 s saw a leap forward in our understanding of the structure and function of the plasma membrane In 1981 S Widell and C Larsson published the first of a series of papers in which plasma membrane vesicles of high yield and purity were isolated from a wide range of plant tissues using aqueous polymer two phase partitioning Concepts in Membrane Structure Roland C. B. Finean, 1981 *Membrane Structure in Disease and Drug Therapy* Svante Cornell, 2000-05-10 This study asserts that cellular and intracellular membranes are active in every aspect of the body's physiology and pathophysiology It compares secondary through to quaternary structures and protein sequences and gauges their influence on health disease and drug therapy The book highlights the importance of correlations homologies and categories *Biological Membranes* Roger Harrison, 2013-11-22 to the Second Edition RESEARCH INTO MEMBRANE

ASSOCIATED PHENOMENA HAS EXPANDED VERY greatly in the five years that have elapsed since the first edition of Biological Membranes was published. It is to take account of rapid advances in the field that we have written the present edition. There is now general acceptance of the fluid mosaic model of membrane structure and of the chemiosmotic interpretation of energetic processes and our attention has shifted from justifying these ideas to explaining membrane functions in their terms. Much more information has become available concerning the role of the plasma membrane in the cell's recognition of and response to external signals and this is reflected in the increased coverage of these topics in the book. The general form of the book remains the same. As before a list of suggested reading sub-divided by chapter is provided and this has been expanded to include a greater proportion of original papers. The book is still primarily designed as an advanced undergraduate text and also to serve as an introduction for post graduate workers entering the field of membrane research. We have taken cognizance of the comments of many reviewers, colleagues and students on the first edition and thank them for their contributions. In particular we wish to acknowledge our colleagues R. Eisinger, G. D. Holman, D. W. Hough and A. H. Rose. Dr. C. R.
