*State of the Art in Neural Networks and Their Applications* Jasjit S. Suri, Ayman S. El-Baz, 2022-11-29 *State of the Art in Neural Networks and Their Applications Volume Two* presents the latest advances in artificial neural networks and their applications across a wide range of clinical diagnoses. The book provides overviews and case studies of advances in the role of machine learning, artificial intelligence, deep learning, cognitive image processing, and suitable data analytics useful for clinical diagnosis and research applications. The application of neural network, artificial intelligence, and machine learning methods in biomedical image analysis have resulted in the development of computer-aided diagnostic CAD systems that aim towards the automatic early detection of several severe diseases. *State of the Art in Neural Networks and Their Applications* is presented in two volumes. Volume One: *Neural Networks in Oncology Imaging* covers lung cancer, prostate cancer, and bladder cancer. Volume Two: *Neural Networks in Brain Disorders and Other Diseases* covers autism spectrum disorder, Alzheimer's disease, attention deficit hyperactivity disorder, hypertension, and other diseases. Written by experienced engineers in the field, these two volumes will help engineers, computer scientists, researchers, and clinicians understand the technology and applications of artificial neural networks. Includes applications of neural networks, AI, machine learning, and deep learning techniques to a variety of oncology imaging technologies. Provides in-depth technical coverage of computer-aided diagnosis CAD, including coverage of computer-aided classification, unified deep learning frameworks, 3D MRI, PET, CT, and more. Covers deep learning cancer identification from histopathological images, medical image analysis, detection, segmentation, and classification via AI.

**Refinement Monoids, Equidecomposability Types, and Boolean Inverse Semigroups** Friedrich Wehrung, 2017-09-09 Adopting a new universal algebraic approach, this book explores and consolidates the link between Tarski's classical theory of equidecomposability types, monoids, abstract measure theory, in the spirit of Hans Dobbertin's work on monoid-valued measures on Boolean algebras, and the nonstable  $K$  theory of rings. This is done via the study of a monoid invariant defined on Boolean inverse semigroups called the type monoid. The new techniques contrast with the currently available topological approaches. Many positive results, but also many counterexamples, are provided.

*Probability Models*, 2024-10-24 *Probability Models Volume 51* in the *Handbook of Statistics* series highlights new advances in the field with this new volume presenting interesting chapters on Stein's methods, Probabilities and thermodynamics, third law, Random Matrix Theory, General tools for understanding fluctuations of random variables, An approximation scheme to compute the Fisher Rao distance between multivariate normal distributions, *Probability Models Applied to Reliability and Availability Engineering*, Backward stochastic differential equation, Stochastic optimization theory and viscous solution of HJB equation, and much more. Additional chapters cover *Probability Models in Machine Learning*, The recursive stochastic algorithm, randomized urn models, and response adaptive randomization in clinical trials, Random matrix theory, local laws and applications, KOO methods, and their high-dimensional consistencies in some multivariate models.

Fourteen Lectures on Inference for Stochastic Processes and A multivariate cumulative damage model and some applications Provides the latest information on probability models Offers outstanding and original reviews on a range of probability models research topics Serves as an indispensable reference for researchers and students alike

**Mathematics for Healthcare** Krasimira Tsaneva-Atanasova, Vanessa Diaz-Zuccarini, 2018-09-28 In 1996 and with extraordinary prescience Panfilov and Holden had highlighted in their seminal book Computational Biology of the Heart that biology was potentially the most mathematical of all sciences Fast forward 20 years and we have seen an explosion of applications of mathematics in not only biology but healthcare that has already produced significant breakthroughs not imaginable more than 20 years ago Great strides have been made in explaining through quantitative methods the underlying mechanisms of human disease not without considerable ingenuity and effort Biological mechanisms are bewildering complex ever evolving multi scale variable difficult to fully access and understand This poses immense challenges to the computational physiology community that nevertheless has developed an impressive arsenal of tools and methods in a vertiginous race to combat disease with the tall order of improving human healthcare Mechanistic models are now contending with the advent of machine learning in healthcare and the hope is that both approaches will be used synergistically since the complexity of human pathophysiology and the difficulty of acquiring human datasets will require both deductive and inductive methods This Research Topic presents work that is currently at the frontier in computational physiology with a striking range of applications from diabetes to graft failure and using a multitude of mathematical tools This collection of articles represents a snapshot in a field that is moving a dizzying speed bringing understanding of fundamental mechanism and solutions to healthcare problems experienced by healthcare systems all over the world
