Journal of Neurology, Neurosurgery and Psychiatry, 1946 **Oxford Textbook of Neurologic and Neuropsychiatric Epidemiology** Carol Brayne, Valery L. Feigin, Lenore J. Launer, Giancarlo Logroscino, 2020-11-02

Neurologic and neuropsychiatric disorders are of great importance to societies and they also raise special considerations in epidemiological research methodology. Not only do neurologic and neuropsychiatric disorders form a major group of disorders associated with ageing populations but those disorders that occur in earlier life can be associated with severe individual family and societal distress and burden. The inter relationship of syndromes and disorders is a topic of major interest and growing biological insights across psychiatry and neurology. This includes not only overlaps in neurodegenerative syndromes but also those related to other systems such as metabolic, inflammatory, immune and vascular disorders. Part of the Oxford Textbooks in Clinical Neurology series, the Oxford Textbook of Neurologic and Neuropsychiatric Epidemiology is designed to focus on the overlaps and inter relationships between neuro epidemiological disorders as well as on ways to harmonise large cohort studies to maximise opportunities for determining causes related to rarer disorders. Divided into three main parts, the book covers 1 the principles of neurologic and neuropsychiatric epidemiology, 2 specific neuropsychiatric disorders and their inter relationships, and 3 the implications of neuro epidemiologic research for patient populations and current medical practice. This comprehensive work serves as an invaluable reference to current neuro epidemiological methods for neurologists, psychiatrists and senior trainees in those disciplines as well as public health practitioners and students with an interest in neurology and neuropsychiatry.

A Clinical Guide to Transcranial Magnetic Stimulation Paul E. Holtzheimer, William McDonald, 2014. The Clinical Guide serves as a reference tool for clinicians in the administration of transcranial magnetic stimulation (TMS) for neuropsychiatric disorders. The primary intent of this Guide is to focus on the clinical applications of TMS and to offer detailed information on the safe and effective administration of TMS with consideration of the neurophysiological effects, particularly in relation to safety, targeting specific cortical areas and practical issues such as the length of treatment sessions and the durability of the TMS response. The Guide focuses on the evidenced based literature and utilizes this literature to inform specific recommendations on the use of rTMS in a clinical setting. The efficacy and safety of TMS for neuropsychiatric disorders, including its use in special populations such as the elderly, will be reviewed to facilitate clinical decision making. The Guide will also outline setting up a TMS service, including practical issues such as considerations for the qualifications of the person administering the treatment, the use of concomitant medications, what equipment is necessary to have in the treatment room, and monitoring the outcomes to treatment. The Guide is intended to be a practical reference for the practicing clinician in the safe and effective administration of TMS.

Mechanisms in Parkinson's Disease Juliana Dushanova, 2012-02-08 Parkinson's disease PD results primarily from the death of dopaminergic neurons in the substantia nigra Current PD medications treat symptoms none halt or retard dopaminergic neuron degeneration The main obstacle to developing neuroprotective therapies is a limited understanding of the key molecular mechanisms that provoke neurodegeneration The discovery of PD genes has led to the hypothesis that misfolding of proteins and dysfunction of the ubiquitin proteasome pathway are pivotal to PD pathogenesis Previously implicated culprits in PD neurodegeneration mitochondrial dysfunction

and oxidative stress may also act in part by causing the accumulation of misfolded proteins in addition to producing other deleterious events in dopaminergic neurons Neurotoxin based models have been important in elucidating the molecular cascade of cell death in dopaminergic neurons PD models based on the manipulation of PD genes should prove valuable in elucidating important aspects of the disease such as selective vulnerability of substantia nigra dopaminergic neurons to the degenerative process
