The Structure and Properties of Color Spaces and the Representation of Color Images Eric Dubois, 2022-05-31

This lecture describes the author's approach to the representation of color spaces and their use for color image processing. The lecture starts with a precise formulation of the space of physical stimuli light. The model includes both continuous spectra and monochromatic spectra in the form of Dirac deltas. The spectral densities are considered to be functions of a continuous wavelength variable. This leads into the formulation of color space as a three dimensional vector space with all the associated structure. The approach is to start with the axioms of color matching for normal human viewers often called Grassmann's laws and developing the resulting vector space formulation. However once the essential defining element of this vector space is identified it can be extended to other color spaces perhaps for different creatures and devices and dimensions other than three. The CIE spaces are presented as main examples of color spaces. Many properties of the color space are examined. Once the vector space formulation is established various useful decompositions of the space can be established. The first such decomposition is based on luminance a measure of the relative brightness of a color. This leads to a direct sum decomposition of color space where a two dimensional subspace identifies the chromatic attribute and a third coordinate provides the luminance. A different decomposition involving a projective space of chromaticity classes is then presented. Finally it is shown how the three types of color deficiencies present in some groups of humans leads to a direct sum decomposition of three one dimensional subspaces that are associated with the three types of cone photoreceptors in the human retina. Next a few specific linear and nonlinear color representations are presented. The color spaces of two digital cameras are also described. Then the issue of transformations between different color spaces is addressed. Finally these ideas are applied to signal and system theory for color images. This is done using a vector signal approach where a general linear system is represented by a three by three system matrix. The formulation is applied to both continuous and discrete space images and specific problems in color filter array sampling and displays are presented for illustration. The book is mainly targeted to researchers and graduate students in fields of signal processing related to any aspect of color imaging.

Wavelet Image Compression William Pearlman, 2022-05-31 This book explains the stages necessary to create a wavelet compression system for images and describes state of the art systems used in image compression standards and current research. It starts with a high level discussion of the properties of the wavelet transform especially the decomposition into multi resolution subbands. It continues with an exposition of the null zone uniform quantization used in most subband coding systems and the optimal allocation of bitrate to the different subbands. Then the image compression systems of the FBI Fingerprint Compression Standard and the JPEG2000 Standard are described in detail. Following that the set partitioning coders SPECK and SPIHT and EZW are explained in detail and compared via a fictitious wavelet transform in actions and number of bits coded in a single pass in the top bit plane. The presentation teaches that besides producing efficient

compression these coding systems except for the FBI Standard are capable of writing bit streams that have attributes of rate scalability resolution scalability and random access decoding Many diagrams and tables accompany the text to aid understanding The book is generous in pointing out references and resources to help the reader who wishes to expand his knowledge know the origins of the methods or find resources for running the various algorithms or building his own coding system Table of Contents Introduction Characteristics of the Wavelet Transform Generic Wavelet based Coding Systems The FBI Fingerprint Image Compression Standard Set Partition Embedded Block SPECK Coding Tree based Wavelet Transform Coding Systems Rate Control for Embedded Block Coders Conclusion *Image Fusion in Remote Sensing* Arian

Azarang, Nasser Kehtarnavaz, 2021-02-24 Image fusion in remote sensing or pansharpening involves fusing spatial panchromatic and spectral multispectral images that are captured by different sensors on satellites This book addresses image fusion approaches for remote sensing applications Both conventional and deep learning approaches are covered First the conventional approaches to image fusion in remote sensing are discussed These approaches include component substitution multi resolution and model based algorithms Then the recently developed deep learning approaches involving single objective and multi objective loss functions are discussed Experimental results are provided comparing conventional and deep learning approaches in terms of both low resolution and full resolution objective metrics that are commonly used in remote sensing The book is concluded by stating anticipated future trends in pansharpening or image fusion in remote sensing **Virtual Reality and Virtual Environments in 10 Lectures** Stanislav Stanković, 2022-06-01 The book is based

on the material originally developed for the course on Virtual Reality which the author was teaching at Tampere University of Technology as well as course on Virtual Environments that the author had prepared for the University for Advancing Studies at Tempe Arizona This original purpose has influenced the structure of this book as well as the depth to which we explore the presented concepts Therefore our intention in this book is to give an introduction into the important issues regarding a series of related concepts of Virtual Reality Augmented Reality and Virtual Environments We do not attempt to go into any of these issues in depth but rather outline general principles and discuss them in a sense broad enough to provide sufficient foundations for a further study In other words we aim to provide a set of keywords to the reader in order give him a good starting point from which he could go on and explore any of these issues in detail Table of Contents Preface

Combating Bad Weather Part I Sudipta Mukhopadhyay, Abhishek Kumar Tripathi, 2022-06-01 Current vision systems are designed to perform in normal weather condition However no one can escape from severe weather conditions Bad weather reduces scene contrast and visibility which results in degradation in the performance of various computer vision algorithms such as object tracking segmentation and recognition Thus current vision systems must include some mechanisms that enable them to perform up to the mark in bad weather conditions such as rain and fog Rain causes the spatial and temporal intensity variations in images or video frames These intensity changes are due to the random distribution and high velocities of the raindrops Fog causes low contrast and whiteness in the image and leads to a shift in the color This book has studied rain and fog from the perspective of vision The book has two main goals 1 removal of rain from videos captured by a moving and static camera 2 removal of the fog from images and videos captured by a moving single uncalibrated camera

system The book begins with a literature survey Pros and cons of the selected prior art algorithms are described and a general framework for the development of an efficient rain removal algorithm is explored Temporal and spatiotemporal properties of rain pixels are analyzed and using these properties two rain removal algorithms for the videos captured by a static camera are developed For the removal of rain temporal and spatiotemporal algorithms require fewer numbers of consecutive frames which reduces buffer size and delay These algorithms do not assume the shape size and velocity of raindrops which make it robust to different rain conditions i e heavy rain light rain and moderate rain In a practical situation there is no ground truth available for rain video Thus no reference quality metric is very useful in measuring the efficacy of the rain removal algorithms Temporal variance and spatiotemporal variance are presented in this book as no reference quality metrics An efficient rain removal algorithm using meteorological properties of rain is developed The relation among the orientation of the raindrops wind velocity and terminal velocity is established This relation is used in the estimation of shape based features of the raindrop Meteorological property based features helped to discriminate the rain and non rain pixels Most of the prior art algorithms are designed for the videos captured by a static camera The use of global motion compensation with all rain removal algorithms designed for videos captured by static camera results in better accuracy for videos captured by moving camera Qualitative and quantitative results confirm that probabilistic temporal spatiotemporal and meteorological algorithms outperformed other prior art algorithms in terms of the perceptual quality buffer size execution delay and system cost The work presented in this book can find wide application in entertainment industries transportation tracking and consumer electronics Table of Contents Acknowledgments Introduction Analysis of Rain Dataset and Performance Metrics Important Rain Detection Algorithms Probabilistic Approach for Detection and Removal of Rain Impact of Camera Motion on Detection of Rain Meteorological Approach for Detection and Removal of Rain from Videos Conclusion and Scope of Future Work Bibliography Authors Biographies
