[Application of Recirculating Aquaculture Systems in Japan](#) Toshio Takeuchi, 2017-12-29 This is the first English book to address the current development of closed recirculating aquaculture systems cRASs in Japan and its implications for industry in the near future It offers an introduction to the topic and discusses the industrial application of cRASs Around Europe cRASs using freshwater have been developed but to date there is little information about cRASs using the saltwater As such the book introduces the technical development of cRASs using the

saltwater in Japan and describes measures necessary for their industrialization. It also discusses in detail various species e.g. flounder, pejerrey, kuruma shrimp, white shrimp and abalone which have been raised in CRASs. Furthermore, it presents wide topics concerning the technological development of aquariums, an area in which progressive Japanese techniques dominate. Lastly, the book also examines CERAS and poly culture in Japan. The book is a valuable resource for a wide readership such as local government officers, energy industry staff, maintenance and system engineers as well as those from the construction, agriculture and fishery industries.

Improving Penaeus Monodon Hatchery Practices, 2007-01-01. The successful farming of tiger shrimp *Penaeus monodon* in India is mainly due to the existence of some 300 hatcheries whose capacity to produce 12 000 million postlarvae PL annually has provided an assured supply of seed. However, the sustainability of the sector is still hampered by many problems, foremost among these being a reliance on wild caught broodstock whose supply is limited both in quantity and in seasonal availability and that are often infected with pathogens. The current low quality of hatchery produced PL due to infection with white spot syndrome virus WSSV and other pathogens entering the hatcheries via infected broodstock, contaminated intake water or other sources due to poor hatchery management practices including inadequate biosecurity is a major obstacle to achieving sustainable shrimp aquaculture in India and the Asia Pacific region. Considering the major contribution of the tiger shrimp to global shrimp production and the economic losses resulting from disease outbreaks, it is essential that the shrimp farming sector invest in good management practices for the production of healthy and quality seed. This document reviews the current state of the Indian shrimp hatchery industry and provides detailed guidance and protocols for improving the productivity, health management, biosecurity and sustainability of the sector. Following a brief review of shrimp hatchery development in India, the major requirements for hatchery production are discussed under the headings: infrastructure, facility maintenance, inlet water quality and treatment, wastewater treatment, biosecurity, standard operating procedures (SOPs), the Hazard Analysis Critical Control Point (HACCP) approach, chemical use during the hatchery production process and health assessment. Pre-spawning procedures covered include the use of wild, domesticated and specific pathogen free (SPF), specific pathogen resistant (SPR) broodstock, broodstock landing centres and holding techniques, broodstock selection, transport, utilization, quarantine, health screening, maturation, nutrition and spawning, egg hatching, nauplius selection, egg nauplius disinfection and washing and holding, disease testing and transportation of nauplii. Post-spawning procedures covered include larval rearing unit preparation, larval rearing, health management, larval nutrition and feed management, important larval diseases, general assessment of larval condition, quality testing, selection of PL for stocking, PL harvest and transportation, nursery rearing, timing of PL stocking, use of multiple species in shrimp hatcheries and documentation and record keeping. Information on the use of chemicals in shrimp hatcheries and examples of various forms for hatchery record keeping are included as Annexes.
