Lambda Expressions

Lambda expressions are a concise way to represent anonymous functions in Java.

They provide a shorthand notation for writing code by allowing the creation of small, inline implementations of functional interfaces.

Lambda expressions consist of parameters, an arrow token (->), and a body.

```java
// Ensures the interface can have just one method
@FunctionalInterface
interface SumFunction {
    int sum(int a, int b);
}

public class LambdaExample {

    public static void main(String[] args) {
        SumFunction sumfunction = (a, b) -> a + b;
        int result = sumfunction.sum(5, 3);
    }

}
```

Functional interfaces are Java interfaces that contain exactly one abstract method. They serve as

The world before Lambda

This is the same example rewritten as a standard anonymous inner Class:

```java
interface SumFunction {
    int sum(int a, int b);
}

SumFunction sumfunction = new SumFunction()
{
    @Override
    public int sum(int a, int b) {
        return a + b;
    }
};

int result = sumfunction.sum(5, 3);
```

All functional interfaces implement exactly one method, which allows for syntactic sugar to implement that one method with much less code.

```
() -> expression | statement
param -> expression | statement
(params) -> expression | statement
(params) -> { expressions and statements }
(types) (params) -> { expressions and statements }
```

red to provide a container for a value that may or may not be present.

Optional is to handle the scenario where a method might return a result.

Set "result" to "value" or get it from

```java
Optional.empty();
```

```java
String result = optional.ofNullable(value)
    .orElse("Value");
```

It a non-null value

```java
ofVal = Optional.of(value);
```

Use Lambda Expressions

It a potentially null value

```java
Optional.ofNullable(val);
```

```java
Optional<String> optionalValue = ...
if (optionalValue.isPresent()) {
    String value = optionalValue.get();
    // Process value
}
```

"if "optional" is null

```java
orElse("Default");
```

```java
// Can be rewritten as:
optionalValue.ifPresent(value -> {
    // Process value
});
```

f" or throw an Exception

```java
orElseThrow() -> new
...not present");
```

Lambda Expressions avoid
statements to check if a valu

Virtual Threads

Virtual threads are lightweight threads that reduce the effort of writing, maintaining, and debugging high-throughput concurrent applications.

For each Virtual Thread, the JVM schedules its execution on a Platform Thread.

It also temporarily copies the Stack chunk for the Virtual Thread from the Heap to the Stack of the Platform Thread.
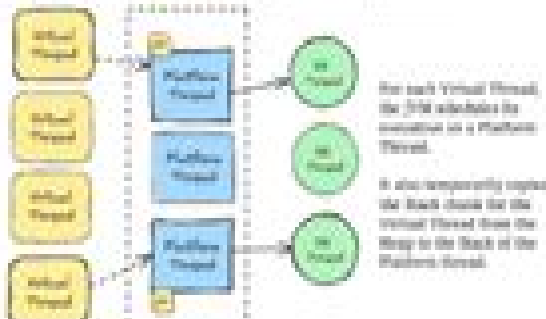

Java Modules

A **Module** is a group of closely related packages and resources along with a new module descriptor file.

A module has a descriptor named **module-info.java**, located at the module's root directory.

This file contains instances about the module, including its name, dependencies on other modules, and what it exports (makes publicly accessible) or keeps encapsulated.

Module Types

- **Automatic Modules:** Once we include a JAR file that don't have a module-info.java file, when placed on the module path, they're treated as modules by the java platform.
- **Named Modules:** These modules have a module-info.java file, explicitly declaring their name, dependencies, exports, and other module-related information. They reside in a named directory and are compiled with the java command.
- **Unnamed Modules:** These modules don't have a module-info.java file. When libraries or code files without module descriptors are placed on the classpath, they are treated as

Java Records

Records are special Classes designed to make it concise and easy to create classes whose primary purpose is to store data, and they are particularly useful for modeling immutable data.

Record Classes are immutable by default, their state cannot be changed once they are created.

```java
record Person(String name, int age) { }

Person person = new Person("Alice", 30);
String name = person.name();
int age = person.age();
person.name = "Bob"; // ...
```

Built-in:
- Accessors
- Constructor
- equals
- hashCode
- toString

A Record nested inside another Record

```java
public record Person(String name, int age) {
}
```

Local Record Classes

```java
public void method() {
    record Address(String city, int zip) { }
}
```

nested level classes. Local Records are available
