Pseudomonas aeruginosa, the Superbug Silpi Basak, Sanchari Das, 2022-07-12 *Pseudomonas aeruginosa* is one of the most commonly isolated bacterial species in clinical microbiology laboratories and it causes infections in hospitalized patients with strains resistant to many antimicrobials. In addition, it can form a biofilm especially in cystic fibrosis patients and patients with medical devices. Extracellular polymeric substances (EPS) or extracellular matrixes in biofilm prevent access of antimicrobial agents, disinfectants, and host-produced immune responses. Antimicrobial resistance in *Pseudomonas aeruginosa* is multifactorial and can be due to mutation, transfer of genes by plasmids or transposons among other causes. Production of lactamases causes resistance to lactam drugs including carbapenems. Against this background of emergence of antibiotic resistance, this book studies different types of lactamases routinely produced by *Pseudomonas aeruginosa* strains in clinical microbiology laboratories. It shows that although molecular methods like Polymerase Chain Reaction (PCR) are the gold standard for detection of different types of lactamases, they are very costly and require expertise.
