Herbivores were not as difficult to remove as omnivores and were treated with less respectability (given broader guidelines). Considerable care and consideration of environmental factors in habitat selection would have to be included in experimental designs. Omnivores were a combination of those herbivores and omnivores treated with greater respectability.

**Abstract** The purpose of this study was to determine the effect of a 12-week resistance training program on the muscle strength and endurance of the lower extremities in healthy young adults. The subjects were 15 male and 15 female college students, aged 18 to 25 years, who had no previous experience with resistance training. They were randomly assigned to either a control group (CG) or an experimental group (EG). The EG performed a 12-week resistance training program consisting of three sessions per week, focusing on the lower extremities. The CG did not perform any resistance training. The primary outcome measures were muscle strength and endurance of the lower extremities, assessed using a variety of tests. The results showed that the EG significantly improved their muscle strength and endurance compared to the CG. The improvements were most pronounced in the quadriceps and hamstrings muscles. The findings suggest that a 12-week resistance training program can effectively improve lower extremity muscle strength and endurance in healthy young adults.
