

Many of the newer metal detectors on the market are **multi-zone**. This means that they have multiple transmit and receive coils, each one at a different height. Basically, it's like having several metal detectors in a single unit.

Eight overlapping detection zones

## **METOR 200 (PRINCIPLE OF OPERATION)**

The transmitter coils generate a pulsed magnetic field around them. Metal objects taken through the detector generate a secondary magnetic field, which is converted into a voltage level by the receiver coils. Metor 200 consists of eight separate overlapping transmitter and receiver coil pairs. The signal received from each receiver coil are processed individually thus the transmitter and receiver coil pairs form eight individual metal detectors. The operation is based on electromagnetic pulsed field technology as below in addition to the above explanation.

- Transmitter pulses cause decaying eddy currents in metal objects inside the sensing area of the WTMD
- The signal induced to the receiver by the eddy currents is sampled and processed in the electronics unit.
- Moving metal objects are detected when the signal exceeds the alarm threshold.
