Models with a Continuum of Convergent Solutions Michael Mussa, 1984 This paper examines five examples of rational expectations models with a continuum of convergent solutions and demonstrates serious difficulties in the economic interpretation of these solutions The five examples are 1 a model of optimal capital accumulation with a negative rate of time preference 2 Taylor s 1977 linear rational expectations model of macroeconomic equilibrium 3 Calvo s 1984 model of contract setting and price dynamics 4 Obstfeld s 1984 equilibrium model of monetary dynamics with individual optimizing agents and 5 Calvo s 1978 life cycle model of savings and asset valuation In every case when these models yield a continuum of convergent infinite horizon solutions these solutions fail to exhibit economically appropriate forward looking dependence of the endogenous variables on the paths of the exogenous forcing variables a difficulty that does not arise under the circumstances where these models yield unique convergent infinite horizon solutions Further the three models that have natural finite horizon versions either lack finite horizon solutions or have solutions that do not converge to any of the infinite horizon solutions Again this difficulty arises only under the circumstances where these models have a continuum of infinite horizon solutions *DSGE Models in Macroeconomics* Nathan Balke, Fabio Canova, Fabio Milani, Mark Wynne, 2012-11-29 This volume of *Advances in Econometrics* contains articles that examine key topics in the modeling and estimation of dynamic stochastic general equilibrium DSGE models Because DSGE models combine micro and macroeconomic theory with formal econometric modeling and inference over the past decade they have become an established framework for analyzing

Henderson,Andrew Theo Levin,1999 We formulate an optimizing agent model in which both labor and product markets exhibit monopolistic competition and staggered nominal contracts The unconditional expectation of average household utility can be expressed in terms of the unconditional variances of the output gap price inflation and wage inflation Monetary policy cannot replicate the Pareto optimal equilibrium that would occur under completely flexible wages and prices that is the model exhibits a tradeoff between stabilizing the output gap price inflation and wage inflation The Pareto optimum is attainable only if either wages or prices are completely flexible For reasonable calibrations of the model we characterize the optimal policy rule Furthermore strict price inflation targeting is clearly suboptimal whereas rules that also respond to either the output gap or wage inflation are nearly optimal
