Ghaffarianhoseini, Farzad Rahimian, Mahesh Babu Purushothaman, 2025-04-19 This book presents peer reviewed articles from the International Conference of Sustainable Development and Smart Built Environments SDSBE2024 held from 6-8 Nov at Auckland New Zealand. It encapsulates cutting edge research in Sustainable Development and Smart Built Environments featuring global scholars. Encompassing diverse themes, the book explores sustainable urban development governance and policy, emphasizing urban greening and climate resilience. It delves into innovative approaches for sustainable transport, intelligent infrastructure, and community well-being. The integration of Data Science, AI, and IoT for optimizing built environments is a focal point, alongside advancements in digital twins and OpenBIM. Social aspects including equity and indigenous perspectives are explored along with health considerations in urban settings. The proceedings serve as a comprehensive resource reflecting the multifaceted advancements driving sustainable and smart urban futures. **The**

Charlesworth, 2010-02-05 Sediments in aqueous systems are of increasing interest to academics, researchers, practitioners, and stakeholders around the world. This book not only covers the characteristics of the sediments themselves but also their physico-chemical impact on aquatic habitats and subsequent management implications. There is a strong focus on methods and instrumentation for collecting data and monitoring of environmental sediment quality, and as a result, a wide range of environments are considered, from urban areas to freshwater estuaries and marine ecosystems. The chapters have been written by international specialists in the field, ensuring a good breadth of examples, experiences, and case studies throughout. This book will appeal to a broad spectrum of interests, from geographers to engineers and environmental scientists, and at undergraduate to post graduate and academic researcher levels. **Dredged**

Material Isolation on the Abyssal Seafloor Philip J. Valent, David K. Young, 1997 This report is the result of an examination of the feasibility of isolating contaminated dredged material on the abyssal seafloor. The focus is on the technical and environmental factors that constrain the considerations of feasibility. The sources of the materials are assumed to be in U.S. coastal waters. A thorough conceptual design of a dredging to abyssal deposition system is analyzed with regard to each subsystem and to the entire operational concept. These subsystems include: 1. a low leakage dredge; 2. equipment for material handling and loading into geosynthetic fabric containers (GFCs); 3. the barge for transport and navigation; and 4. the subsystem for releasing the GFCs to sink to the abyssal seafloor isolation site. Particular consideration is given to the exclusion of dredged material from the ocean's productive zone in the upper 1000 m; this exclusion requires highly stable, reliable navigation and seakeeping by the barge transporter and control of the configuration of GFCs within it. New theoretical models and previous empirical results are used to predict GFC motion through the water column and response to impact on the abyssal seafloor, including the case of potential release of contaminated turbid water at impact. A geochemical model of the temporal and spatial evolution of the post-deposition geochemistry of the water column, the GFC contents, and the

sediments below is developed and analyzed the results show that release of metals into the ocean waters would be insignificant A model of the biological impacts of the introduction of dredged material in the abyssal environment is used to infer that 1 biological diversity in the vicinity of the deposition site will be diminished 2 biomass will be increased by dominance of a few fast growing opportunistic benthic species and 3 concentrations of trace elements and organic contgt h1
