

2.2.7. REAR BRAKE BLEEDING

Any air trapped in the hydraulic circuit will act as a cushion and take up most of the pressure applied by the master cylinder; this will impair the operation of the brake calipers and reduce braking efficiency. A spongy feel of the brake lever and loss of braking mean that there is air in the circuit.

DANGER

This is a dangerous condition that makes the vehicle unsafe to ride; each time the brakes are removed, it is essential to bleed the hydraulic circuit once the brakes have been refitted and the brake system is back to normal operating conditions.

NOTE Place the vehicle on level ground before beginning the bleeding procedure. While bleeding the hydraulic circuit, top up the reservoir with brake fluid as required. Make sure there is always some fluid in the reservoir throughout the process.

- Remove the bleed valve rubber cap.
- Insert one end of a transparent plastic tubing inside the rear brake caliper bleed valve and the other end in a container.
- Pump the rear brake lever quickly. Repeat several times, then keep the lever pulled in.
- Slacken the bleed valve by one quarter of a turn to let the brake fluid drain into the container; this will remove any tension from the lever and help it travel fully home.
- Retighten the bleed valve before the lever is fully squeezed in.
- Repeat this process until the fluid draining into the container is totally clear of air bubbles.

NOTE While bleeding the hydraulic circuit, top up the reservoir with brake fluid as required. Make sure there is always some fluid in the reservoir throughout the process.

- Tighten the bleed valve and remove the tubing.
- Add brake fluid to the reservoir until the fluid has reached correct level.
- Refit the rubber cap.

CHANGING THE PADS

- Loosen and remove the two screws.
